

Amazon SAA-C03 Schulungsangebot & SAA-C03 Prüfung

Übrigens, Sie können die vollständige Version der Pass4Test SAA-C03 Prüfungsfragen aus dem Cloud-Speicher herunterladen:
<https://drive.google.com/open?id=1jNVuebLeto84A-aumau9BYvA1uN6LdsB>

In der heutigen wettbewerbsorientierten IT-Branche hat man viele Vorteile, wenn man die Amazon SAA-C03 Zertifizierungsprüfung besteht. Mit einem Amazon SAA-C03 Zertifikat kann man ein hohes Gehalt erhalten. Menschen, die Amazon SAA-C03 Zertifikat erhalten, haben oft viel höheres Gehalt als Kollegen ohne Amazon SAA-C03 Zertifikat. Jedoch ist es nicht sehr einfach, die Amazon SAA-C03 Zertifizierungsprüfung zu bestehen. So hilft Pass4Test Ihnen, Ihr Gehalt zu erhöhen.

Die SAA-C03-Prüfung wurde entwickelt, um das Verständnis des Kandidaten für AWS-Dienste zu bewerten und wie sie zum Entwerfen und Bereitstellen von Anwendungen in einer Cloud-Umgebung verwendet werden können. Die Prüfung besteht aus 65 Fragen der Multiple-Choice- und Multiple-Response-Fragen, die innerhalb von 130 Minuten beantwortet werden müssen. Die Bestehenszahl für diese Prüfung beträgt 720 von 1000 Punkten.

Neueste AWS Certified Solutions Architect - Associate Prüfung pdf & SAA-C03 Prüfung Torrent

Wenn Sie noch zögern, ob unsere Prüfungsunterlagen der Amazon SAA-C03 kaufen, können Sie unsere Demo der Softwaren zuerst probieren! Danach werden Sie überzeugen, dass unsere Produkte Ihnen helfen können, Amazon SAA-C03 zu bestehen. Da unser professionelles Team der Pass4Test sich kontinuierlich kräftigen und die Unterlagen der Amazon SAA-C03 immer aktualisieren. Auf diese Weise siegen Sie beim Anfang der Vorbereitung!

Um sich auf die Amazon SAA-C03-Prüfung vorzubereiten, werden den Kandidaten empfohlen, sich mit der AWS-Plattform und ihren Kerndiensten vertraut zu machen. Sie sollten auch ein gutes Verständnis der Cloud - Computing -Konzepte wie Virtualisierung, Speicherung und Netzwerk haben. Es gibt viele online verfügbare Ressourcen, mit denen die Kandidaten die Prüfung vorbereiten können, einschließlich AWS -Dokumentation, Schulungskurse und Praxisprüfungen.

Amazon AWS Certified Solutions Architect - Associate SAA-C03 Prüfungsfragen mit Lösungen (Q227-Q232):

227. Frage

A company has several web servers that need to frequently access a common Amazon RDS MySQL Multi-AZ DB instance. The company wants a secure method for the web servers to connect to the database while meeting a security requirement to rotate user credentials frequently.

Which solution meets these requirements?

- A. Store the database user credentials in AWS Secrets Manager. Grant the necessary IAM permissions to allow the web servers to access AWS Secrets Manager.
- B. Store the database user credentials in a secure Amazon S3 bucket. Grant the necessary IAM permissions to allow the web

servers to retrieve credentials and access the database.

- C. Store the database user credentials in files encrypted with AWS Key Management Service (AWS KMS) on the web server file system. The web server should be able to decrypt the files and access the database
- D. Store the database user credentials in AWS Systems Manager OpsCenter Grant the necessary IAM permissions to allow the web servers to access OpsCenter

Antwort: A

Begründung:

Explanation

AWS Secrets Manager helps you protect secrets needed to access your applications, services, and IT resources. The service enables you to easily rotate, manage, and retrieve database credentials, API keys, and other secrets throughout their lifecycle.

<https://docs.aws.amazon.com/secretsmanager/latest/userguide/intro.html>

228. Frage

A company's application is running on Amazon EC2 instances within an Auto Scaling group behind an Elastic Load Balancing (ELB) load balancer. Based on the application's history, the company anticipates a spike in traffic during a holiday each year. A solutions architect must design a strategy to ensure that the Auto Scaling group proactively increases capacity to minimize any performance impact on application users.

Which solution will meet these requirements?

- **A. Create a recurring scheduled action to scale up the Auto Scaling group before the expected period of peak demand**
- B. Increase the minimum and maximum number of EC2 instances in the Auto Scaling group during the peak demand period
- C. Create an Amazon CloudWatch alarm to scale up the EC2 instances when CPU utilization exceeds 90%.
- D. Configure an Amazon Simple Notification Service (Amazon SNS) notification to send alerts when there are autoscaling_EC2_INSTANCE_LAUNCH events.

Antwort: A

Begründung:

Understanding the Requirement: The company anticipates a spike in traffic during a holiday and wants to ensure the Auto Scaling group can handle the increased load without impacting performance.

Analysis of Options:

CloudWatch Alarm: This reacts to spikes based on metrics like CPU utilization but does not proactively scale before the anticipated demand.

Recurring Scheduled Action: This allows the Auto Scaling group to scale up based on a known schedule, ensuring additional capacity is available before the expected spike.

Increase Min/Max Instances: This could result in unnecessary costs by maintaining higher capacity even when not needed.

SNS Notification: Alerts on scaling events but does not proactively manage scaling to prevent performance issues.

Best Solution for Proactive Scaling:

Create a recurring scheduled action: This approach ensures that the Auto Scaling group scales up before the peak demand, providing the necessary capacity proactively without manual intervention.

Scheduled Scaling for Auto Scaling

229. Frage

A company runs a web application on Amazon EC2 instances in an Auto Scaling group that has a target group. The company designed the application to work with session affinity (sticky sessions) for a better user experience.

The application must be available publicly over the internet as an endpoint. A WAF must be applied to the endpoint for additional security. Session affinity (sticky sessions) must be configured on the endpoint. Which combination of steps will meet these requirements? (Select TWO)

- A. Create a second target group. Add Elastic IP addresses to the EC2 instances
- B. Create a public Network Load Balancer. Specify the application target group.
- **C. Create a public Application Load Balancer. Specify the application target group.**
- **D. Create a web ACL in AWS WAF. Associate the web ACL with the endpoint.**
- E. Create a Gateway Load Balancer. Specify the application target group.

Antwort: C,D

Begründung:

C and E are the correct answers because they allow the company to create a public endpoint for its web application that supports session affinity (sticky sessions) and has a WAF applied for additional security. By creating a public Application Load Balancer, the company can distribute incoming traffic across multiple EC2 instances in an Auto Scaling group and specify the application target group. By creating a web ACL in AWS WAF and associating it with the Application Load Balancer, the company can protect its web application from common web exploits. By enabling session stickiness on the Application Load Balancer, the company can ensure that subsequent requests from a user during a session are routed to the same target. Reference:

Application Load Balancers

Target Groups for Your Application Load Balancers

How Application Load Balancer Works with Sticky Sessions

230. Frage

A company uses AWS Organizations to run workloads within multiple AWS accounts. A tagging policy adds department tags to AWS resources when the company creates tags.

An accounting team needs to determine spending on Amazon EC2 consumption. The accounting team must determine which departments are responsible for the costs regardless of AWS account. The accounting team has access to AWS Cost Explorer for all AWS accounts within the organization and needs to access all reports from Cost Explorer.

Which solution meets these requirements in the MOST operationally efficient way?

- A. From the Organizations member account billing console, activate a user-defined cost allocation tag named department. Create one cost report in Cost Explorer grouping by the tag name, and filter by EC2.
- B. From the Organizations management account billing console, activate a user-defined cost allocation tag named department. Create one cost report in Cost Explorer grouping by tag name, and filter by EC2.
- **C. From the Organizations management account billing console, activate an AWS-defined cost allocation tag named department. Create one cost report in Cost Explorer grouping by tag name, and filter by EC2.**
- D. From the Organizations member account billing console, activate an AWS-defined cost allocation tag named department. Create one cost report in Cost Explorer grouping by tag name and filter by EC2.

Antwort: C

Begründung:

This solution meets the following requirements:

It is operationally efficient, as it only requires one activation of the cost allocation tag and one creation of the cost report from the management account, which has access to all the member accounts' data and billing preferences.

It is consistent, as it uses the AWS-defined cost allocation tag named department, which is automatically applied to resources when the company creates tags using the tagging policy enforced by AWS Organizations.

This ensures that the tag name and value are the same across all the resources and accounts, and avoids any discrepancies or errors that might arise from user-defined tags.

It is informative, as it creates one cost report in Cost Explorer grouping by the tag name, and filters by EC2.

This allows the accounting team to see the breakdown of EC2 consumption and costs by department, regardless of the AWS account. The team can also use other features of Cost Explorer, such as charts, filters, and forecasts, to analyze and optimize the spending.

231. Frage

A company is migrating an application from on-premises servers to Amazon EC2 instances. As part of the migration design requirements, a solutions architect must implement infrastructure metric alarms. The company does not need to take action if CPU utilization increases to more than 50% for a short burst of time. However, if the CPU utilization increases to more than 50% and read IOPS on the disk are high at the same time, the company needs to act as soon as possible. The solutions architect also must reduce false alarms.

What should the solutions architect do to meet these requirements?

- A. Create Amazon CloudWatch Synthetics canaries to monitor the application and raise an alarm.
- B. Create Amazon CloudWatch dashboards to visualize the metrics and react to issues quickly.

- C. Create Amazon CloudWatch composite alarms where possible.
- D. Create single Amazon CloudWatch metric alarms with multiple metric thresholds where possible.

Antwort: C

Begründung:

Composite alarms determine their states by monitoring the states of other alarms. You can ****use composite alarms to reduce alarm noise****. For example, you can create a composite alarm where the underlying metric alarms go into ALARM when they meet specific conditions. You then can set up your composite alarm to go into ALARM and send you notifications when the underlying metric alarms go into ALARM by configuring the underlying metric alarms never to take actions. Currently, composite alarms can take the following actions: https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/Create_Composite_Alarm.html
