CS0-003 Instant Discount, CS0-003 Valid Braindumps Free

You many attend many certificate exams but you unfortunately always fail in or the certificates you get can't play the rules you wants and help you a lot. So what certificate exam should you attend and what method should you use to let the certificate play its due rule? You should choose the test CompTIA certification and buys our CS0-003 learning file to solve the problem. Passing the test CS0-003 certification can help you increase your wage and be promoted easily and buying our CS0-003 prep guide dump can help you pass the test smoothly. Our CS0-003 Certification material is closely linked with the test and the popular trend among the industries and provides all the information about the test. The answers and questions seize the vital points and are verified by the

industry experts. Diversified functions can help you get an all-around preparation for the test. Our online customer service replies the clients' questions about our CS0-003 certification material at any time.

The CS0-003 exam covers a wide range of topics related to cybersecurity, including threat management, vulnerability management, incident response, and compliance and assessment. To pass the exam, candidates are required to demonstrate their ability to identify and analyze cybersecurity threats, and to implement effective security measures to mitigate them. CS0-003 Exam also tests the candidates' knowledge of security tools and technologies, as well as their ability to communicate security-related issues to technical and non-technical stakeholders.

CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q212-Q217):

NEW QUESTION # 212
A company's user accounts have been compromised. Users are also reporting that the company's internal portal is sometimes only accessible through HTTP, other times; it is accessible through HTTPS. Which of the following most likely describes the observed activity?

- A. The web server cannot handle an increasing amount of HTTPS requests so it forwards users to port 80
- B. There is an issue with the SSL certificate causinq port 443 to become unavailable for HTTPS access
- C. An error was caused by BGP due to new rules applied over the company's internal routers
- D. An on-path attack is being performed by someone with internal access that forces users into port 80

Answer: D

Explanation:
Explanation
An on-path attack is a type of man-in-the-middle attack where an attacker intercepts and modifies network traffic between two parties. In this case, someone with internal access may be performing an on-path attack by forcing users into port 80, which is used for HTTP communication, instead of port 443, which is used for HTTPS communication. This would allow the attacker to compromise the user accounts and access the company's internal portal.

NEW QUESTION # 213
A cybersecurity analyst is recording the following details
* ID
* Name
* Description
* Classification of information
* Responsible party
In which of the following documents is the analyst recording this information?

- A. Incident response playbook
- B. Change control documentation
- C. Risk register
- D. Incident response plan

Answer: C

Explanation:
A risk register typically contains details like ID, name, description, classification of information, and responsible party. It's used for tracking identified risks and managing them.
Recording details like ID, Name, Description, Classification of information, and Responsible party is typically done in a Risk Register. This document is used to identify, assess, manage, and monitor risks within an organization. It's not directly related to incident response or change control documentation.

NEW QUESTION # 214
A security analyst must assist the IT department with creating a phased plan for vulnerability patching that meets established SLAs. Which of the following vulnerability management elements will best assist with prioritizing a successful plan?

- A. Annual recurrence

- B. Affected hosts
- C. Mitigation strategy
- D. Risk score

Answer: D

Explanation:
Risk scoring is the best method for prioritizing patching, as it considers factors like CVSS severity, exploitability, asset criticality, and business impact.
Option A (Affected hosts) is relevant but does not determine priority without a risk assessment.
Option C (Mitigation strategy) is useful but focuses on alternative protections rather than prioritization.
Option D (Annual recurrence) is not a standard method for vulnerability prioritization.
Thus, B is the correct answer, as risk scores allow organizations to prioritize patching efforts effectively.

NEW QUESTION # 215

After reviewing the final report for a penetration test, a cybersecurity analyst prioritizes the remediation for input validation vulnerabilities. Which of the following attacks is the analyst seeking to prevent?

- A. Phishing
- B. DNS poisoning
- C. Cross-site scripting
- D. Pharming

Answer: C

NEW QUESTION # 216

A security analyst discovers an LFI vulnerability that can be exploited to extract credentials from the underlying host. Which of the following patterns can the security analyst use to search the web server logs for evidence of exploitation of that particular vulnerability?

- A. /etc/ shadow
- B. cat /proc/self/
- C. curl localhost
- D. ; printenv

Answer: A

Explanation:
/etc/shadow is the pattern that the security analyst can use to search the web server logs for evidence of exploitation of the LFI vulnerability that can be exploited to extract credentials from the underlying host. LFI stands for Local File Inclusion, which is a vulnerability that allows an attacker to include local files on the web server into the output of a web application. LFI can be exploited to extract sensitive information from the web server, such as configuration files, passwords, or source code. The /etc/shadow file is a file that stores the encrypted passwords of all users on a Linux system. If an attacker can exploit the LFI vulnerability to include this file into the web application output, they can obtain the credentials of the users on the web server. Therefore, the security analyst can look for /etc/shadow in the request line of the web server logs to see if any attacker has attempted or succeeded in exploiting the LFI vulnerability.
