Do you have registered for Nutanix NCP-EUC exam? With the drawing near of the examination, I still lack of confidence to pass NCP-EUC test. Then I have not enough time to read reference books. About the above problem, how should I do? Is there shortcut to pass the exam? Do you have such a mood like that, now? There is no need for hurry. Even if the examination time is near, you are also given the opportunity to prepare for NCP-EUC Certification test. And what is the opportunity? It is Exam4Tests NCP-EUC dumps which is the most effective materials and can help you prepare for the exam in a short period of time. What's more, Exam4Tests practice test materials have a high hit rate. 100% satisfaction guarantee! As well as you memorize these questions and answers in our dumps, you must pass Nutanix NCP-EUC certification.

The NCP-EUC Certification Exam is a valuable certification for IT professionals who work with Nutanix EUC solutions. Nutanix Certified Professional - End User Computing (NCP-EUC) 6.10 Exam certification demonstrates that the candidate has the skills and knowledge needed to design, deploy, and manage Nutanix EUC solutions. It also provides a competitive advantage in the job market, as employers often seek candidates with certifications that demonstrate their expertise.

## Nutanix Certified Professional - End User Computing (NCP-EUC) 6.10 Exam Sample Questions (Q137-Q142):

### NEW QUESTION # 137

In Frame, what occurs when the minimum value in the capacity settings is set to less than the Quick Publish value specified?

- A. Quick Publish value settings are ignored, and regular publishing is performed.
- B. Regular publish value settings are ignored and Quick Publish values are performed.
- C. A user will not be able to launch their Frame Desktop or Application
- D. The administrator will receive an error notification.

**Answer: A**

Explanation:

Nutanix Frame allows administrators to configure capacity settings for their virtual machines (VMs) that run virtual apps and desktops.

Capacity settings include:

Default capacity, which defines how many VMs are turned on when there is no user activity on the account. This setting helps reduce costs by turning off unused VMs.

Active capacity, which defines how many VMs are turned on when there is user activity on the account. This setting helps improve performance by ensuring enough VMs are available for user sessions.

Quick Publish, which defines how many VMs are updated with the latest changes when publishing a new version of an app or desktop. This setting helps speed up the publishing process by updating only a subset of VMs instead of all of them.

According to Nutanix Frame documentation<sup>1</sup>, Quick Publish value should be equal to or less than the active capacity value for each instance type.

If Quick Publish value is set higher than active capacity value, then Frame will ignore Quick Publish value and perform regular publishing instead.

### NEW QUESTION # 138

An organization has decided to leverage the Security Configuration Management Automation (SCMA) framework to continuously inspect services for deviations from established security policies. How does Nutanix keep these scans from impacting cluster performance?

- A. SCMA inconsistencies aren't reverted.
- B. SCMA is fully managed by Prism Central.
- C. SCMA checks are bypassed by STIG.
- **D. SCMA has a low system priority.**

**Answer: D**

Explanation:

Nutanix leverages the Security Configuration Management Automation (SCMA) framework to ensure that services are constantly inspected for variance to the security policy. This framework checks multiple security entities for both Nutanix storage and AHV, automatically reporting log inconsistencies and reverting them to the baseline where applicable.

To prevent these continuous inspections from negatively affecting the cluster's operation, the Nutanix Security Guide specifies that STIG (Security Technical Implementation Guide) scans have the lowest system priority within the virtual storage controller. This design ensures that security checks do not interfere with platform performance or user workloads, regardless of whether the schedule is set to run hourly, daily, weekly, or monthly.

### NEW QUESTION # 139

An administrator receives complaints that non-persistent VDI sessions for an entire department have seen a dramatic change in performance. The most noticeable change is sluggish mouse and keyboard response within open sessions. No additional virtual desktops have been added to the environment in the previous 60 days.

What is the most likely culprit?

- A. Over-provisioning of virtual infrastructure
- B. Unoptimized master image
- C. Legacy network drivers or virtual agents
- **D. Antivirus or Security Agent Scanning**

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Nutanix End User Computing documents:

According to Nutanix VDI Troubleshooting and Performance Tuning best practices:

\* Symptom Analysis: "Sluggish mouse and keyboard response" is a classic symptom of high CPU contention or high Latency on the host or VM. Since the environment was previously stable ("No additional virtual desktops added") and the change was "dramatic," it points to a new process consuming resources unexpectedly.

\* The "Agent" Factor: In non-persistent VDI environments, a common cause for sudden performance degradation affecting an "entire department" is an Antivirus or Security Agent running a scheduled scan or a signature update simultaneously across all clones. This creates a "storm" of IOPS and CPU usage (often called an AV storm), starving the user sessions of the resources needed for basic input processing (mouse/keyboard).

\* Why not others?

\* Unoptimized master image (B): This would cause poor performance from day one, not a "dramatic change" after 60 days of stability.

\* Legacy drivers (C): Drivers do not degrade suddenly; they would cause issues from the time of installation.

\* Over-provisioning (D): This usually results in gradual degradation as user concurrency increases, not a sudden cliff-edge drop in performance if user counts haven't changed.

#### NEW QUESTION # 140

What are two primary purposes of a Frame utility Server? (Choose two.)

- A. Test and develop virtual desktops.
- B. Backend for a client-server application
- C. shared file server
- D. A server that monitors virtual desktop usage

**Answer: B,C**

Explanation:

Frame utility server is a stand-alone, general purpose Windows server that can be helpful for a variety of use cases, including:  
License server: Install a network licensing manager for your software on a Frame utility server. Your production instances can then connect to this server to get the licenses.

Backend for a client-server application: Install a database or other backend service on a Frame utility server. Your production instances can then connect to this server to run your client-server application.

Shared file server: Install a file sharing service on a Frame utility server. Your production instances can then access shared files from this server.

Test and develop virtual desktops: Use a Frame utility server as a sandbox environment to test and develop your virtual desktops before publishing them to your production account.

#### NEW QUESTION # 141

What disaster recovery feature does the Nutanix platform provide in a VMware Horizon environment?

- A. Nutanix is the only vendor that supports replication of full clones.
- B. Nutanix is the only vendor that supports replication of linked clones.
- C. Block awareness permits smaller clusters to lose up to four nodes
- D. Rack awareness permits smaller clusters to lose up to six nodes

**Answer: B**

Explanation:

Nutanix is the only vendor that supports replication of linked clones. This means that option A is correct.

However, I cannot guarantee the accuracy or validity of this information, so please verify it with other sources before using it.
