Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q191-Q196):

NEW QUESTION # 191
Before below options what you need for executing INSERT command in Snowflake worksheet?

- A. Active Warehouse
- B. Database
- C. Schema
- D. All of them

Answer: D

Explanation:
Executing an INSERT command in a Snowflake worksheet requires three components to be explicitly selected:
* Active Warehouse- Provides compute resources to process the query. Without an active warehouse, DML operations cannot execute.
* Database- The table receiving the INSERT must reside in the active database context.
* Schema- The targeted table must be within a selected schema.
All three define the fully qualified context for locating and writing to the correct object. Snowflake's compute /storage separation ensures compute is only used when warehouses are active. Schema and database selection ensure correct namespace resolution.

NEW QUESTION # 192
How can Snowsight be used to monitor the performance of a virtual warehouse?

- A. Use the DESCRIBE WAREHOUSE command.
- B. Use the QUERY_HISTORY view.
- C. Use the LOAD_HISTORY view.
- D. Use the SHOW WAREHOUSES command.

Answer: B

Explanation:
To monitor virtual warehouse performance in Snowsight, the correct approach is using the QUERY_HISTORY view or its Snowsight equivalent under the Activity section. QUERY_HISTORY provides detailed metrics on execution time, queueing, credit consumption, compilation time, and warehouse utilization for every executed query. By analyzing this information, users can diagnose issues such as concurrency bottlenecks, under-sized warehouses, long-running queries, or excessive I/O.
SHOW WAREHOUSES returns metadata about warehouse configurations (size, state, scaling policy) but does not provide performance data. LOAD_HISTORY tracks COPY INTO operations only and is not representative of general warehouse workload. DESCRIBE WAREHOUSE shows configuration details but no runtime or historical performance metrics.
Thus, the most accurate and complete way to assess warehouse performance-particularly execution delays, queueing, or excessive credit usage-is by using QUERY_HISTORY.

NEW QUESTION # 193
Which Snowflake architectural layer is responsible for persistent storage of customer data?

- A. Cloud Services Layer
- B. Query Processing Layer
- C. Database Storage Layer
- D. Virtual Warehouse Layer

Answer: C

Explanation:
The Database Storage Layer is responsible for persistently storing all customer data in Snowflake. This layer automatically manages micro-partitioning, compression, and metadata. Data is stored in optimized, columnar formats inside cloud object storage (AWS S3, Azure Blob Storage, or GCP Storage). Users cannot manipulate physical storage directly; access is only through SQL operations. Other layers serve different purposes: Cloud Services manages metadata and orchestration, Query Processing Layer executes workloads, and Virtual Warehouses provide compute but do not store data.

NEW QUESTION # 194
Which of the following statements are true about Zero-Copy Cloning in Snowflake? (Select TWO)

- A. It is immediate and metadata-only operation.
- B. It creates a writable copy of an object.
- C. It duplicates the underlying data storage.
- D. It requires significant additional storage.

Answer: A,B

Explanation:
Zero-Copy Cloning is ametadata-only operation, creating instantaneous clones without copying underlying data. Clones are fully writable and operate independently. Snowflake only allocates storage when data diverges due to modifications. It does not require significant storage nor duplicate physical data.

NEW QUESTION # 195
What information can be obtained by describing a table in Snowflake? (Choose any 3 options)

- A. Column names and data types
- B. Indexes and keys
- C. Table constraints
- D. Table Origin

Answer: A,B,C

Explanation:
The DESCRIBE TABLE (or DESC TABLE) command in Snowflake provides core metadata about table structure. This includescolumn names,data types,nullability, and default values. It also returnsconstraintsif applied, such as PRIMARY KEY, UNIQUE, and CHECK constraints. Snowflake additionally displays information regarding clustering keys and other table characteristics. The command does not show table origin; Snowflake does not track lineage information directly through DESCRIBE TABLE. Indexes in Snowflake are not traditional B-tree indexes-Snowflake uses micro-partition pruning instead-but DESCRIBE TABLE can show clustering keys, which function similarly by enabling optimized data skipping.
Therefore, column definitions, constraints, and keys are all valid outputs of DESCRIBE TABLE.
