

Actual DVA-C02 Test Training Questions are Very Helpful Exam Materials

Just imagine that if you get the DVA-C02 certification, then getting high salary and promotion will completely have no problem. At the same time, you will have more income to lead a better life and develop your life quality. Who will refuse such a wonderful dream? So you must struggle for a better future. Life is a long journey. It is never too late to learn new things. Our DVA-C02 Study Materials will never disappoint you. And you will get all you desire with our DVA-C02 exam questions.

Amazon DVA-C02 Exam covers a range of topics related to AWS development, including AWS core services, security and compliance, development and deployment, and troubleshooting. Candidates must have a good understanding of AWS services such as EC2, S3, DynamoDB, and Elastic Beanstalk, as well as knowledge of programming languages such as Java, Python, and Node.js. Passing this certification exam demonstrates that the individual has the necessary skills to design and develop scalable, secure, and fault-tolerant applications on the AWS cloud platform.

DVA-C02 Valid Exam Test, Test DVA-C02 Registration

EduDump has designed highly effective Amazon DVA-C02 exam questions and an online DVA-C02 practice test engine to help candidates successfully clear the AWS Certified Developer - Associate exam. These two simple, easy, and accessible learning formats instill confidence in candidates and enable them to learn all the basic and advanced concepts required to pass the AWS Certified Developer - Associate (DVA-C02) Exam.

Achieving the Amazon DVA-C02 Certification demonstrates that the candidate has the skills and knowledge required to develop and maintain applications on the AWS platform. It also indicates that the candidate has a deep understanding of AWS services and best practices, and is able to design and implement scalable, reliable, and highly available applications on the AWS platform.

Amazon AWS Certified Developer - Associate Sample Questions (Q25-Q30):

NEW QUESTION # 25

A company is using Amazon API Gateway to develop an API for its application on AWS. A developer needs to test and generate API responses. Other teams are required to test the API immediately.

What should the developer do to meet these requirements?

- A. Set up the request validators in the API's OpenAPI definition file. Import the OpenAPI definitions into API Gateway to test the API.
- B. Set up a mock integration request in API Gateway. Configure the method's integration request and integration response to associate a response with a given status code.
- C. Set up a request parameter-based Lambda authorizer to control access to the API. Configure the Lambda function with the necessary mapping template.
- D. Set up a gateway response for the API in API Gateway. Configure response headers with hardcoded HTTP status codes and responses.

Answer: B

NEW QUESTION # 26

A developer has AWS Lambda functions that need to access a company's internal data science libraries and reference data. Separate teams manage the libraries and the data. The teams must be able to update and upload new data independently. The Lambda functions are connected to the company's central VPC.

Which solution will provide the Lambda functions with access to the libraries and data?

- A. Attach an Amazon Elastic Block Store (Amazon EBS) volume to the Lambda functions by using EBS Multi-Attach in the central VPC. Update the Lambda function execution roles to give the functions to access the EBS volume. Update the Lambda function code to reference the files in the EBS volume.
- B. Compress the libraries and reference data in a Lambda /tmp folder. Update the Lambda function code to reference the files in the /tmp folder.
- C. Set up an Amazon FSx for Windows File Server file system with mount targets in the central VPC. Configure the Lambda functions to mount the Amazon FSx file system. Update the Lambda function execution roles to give the functions to access the Amazon FSx file system.
- **D. Set up an Amazon Elastic File System (Amazon EFS) file system with mount targets in the central VPC. Configure the Lambda functions to mount the EFS file system. Update the Lambda function execution roles to give the functions to access the EFS file system.**

Answer: D

Explanation:

Configure a function to mount an Amazon Elastic File System (Amazon EFS) file system to a local directory.

NEW QUESTION # 27

A company has an ecommerce application. To track product reviews, the company's development team uses an Amazon DynamoDB table.

Every record includes the following

- * A Review ID a 16-digit universally unique identifier (UUID)
- * A Product ID and User ID 16 digit UUIDs that reference other tables
- * A Product Rating on a scale of 1-5
- * An optional comment from the user

The table partition key is the Review ID. The most performed query against the table is to find the 10 reviews with the highest rating for a given product.

Which index will provide the FASTEST response for this query"?

- A. A local secondary index (LSI) with Review ID as the partition key and Product ID as the sort key
- **B. A global secondary index (GSI) with Product ID as the partition key and Product Rating as the sort key**
- C. A local secondary index (LSI) with Product ID as the partition key and Product Rating as the sort key
- D. A global secondary index (GSI) with Product ID as the partition key and Review ID as the sort key

Answer: B

Explanation:

This solution allows the fastest response for the query because it enables the query to use a single partition key value (the Product ID) and a range of sort key values (the Product Rating) to find the matching items. A global secondary index (GSI) is an index that has a partition key and an optional sort key that are different from those on the base table. A GSI can be created at any time and can be queried or scanned independently of the base table. A local secondary index (LSI) is an index that has the same partition key as the base table, but a different sort key. An LSI can only be created when the base table is created and must be queried together with the base table partition key. Using a GSI with Product ID as the partition key and Review ID as the sort key will not allow the query to use a range of sort key values to find the highest ratings. Using an LSI with Product ID as the partition key and Product Rating as the sort key will not work because Product ID is not the partition key of the base table. Using an LSI with Review ID as the partition key and Product ID as the sort key will not allow the query to use a single partition key value to find the matching items. Reference: [Global Secondary Indexes], [Querying]

NEW QUESTION # 28

A developer has code that is stored in an Amazon S3 bucket. The code must be deployed as an AWS Lambda function across multiple accounts in the same AWS Region as the S3 bucket. An AWS CloudFormation template that runs for each account will deploy the Lambda function.

What is the MOST secure way to allow CloudFormation to access the Lambda code in the S3 bucket?

- A. Use a service-based link to grant the Lambda function the S3 ListBucket and GetObject permissions by explicitly adding the S3 bucket's account number in the resource.
- B. Use a service-based link to grant the Lambda function the S3 GetObject permission. Add a resource of "*" to allow access to the S3 bucket.
- C. Grant the CloudFormation service role the S3 GetObject permission. Add a bucket policy to Amazon S3 with the principal of "*".
- **D. Grant the CloudFormation service role the S3 ListBucket and GetObject permissions. Add a bucket policy to Amazon S3 with the principal of "AWS": [account numbers].**

Answer: D

Explanation:

Option (A) is the safest way to allow CloudFormation to access the Lambda code in the S3 bucket because it limits access to the specific accounts that need to deploy the Lambda functions. The bucket policy grants S3 ListBucket and GetObject permissions to the CloudFormation service role only for the accounts specified in the principal.

NEW QUESTION # 29

A company has an application that runs on Amazon EC2 instances and stores sensitive data. The application encrypts the data by using an AWS KMS customer managed key with key material that has been imported from outside of AWS.

A developer accidentally deletes the key material, and the application is unable to read the encrypted data.

What should the developer do to fix the application with the LEAST amount of effort?

- A. Generate an AWS managed KMS key. Reconfigure the application to use this key.
- B. Recover the deleted key material by opening a request with AWS Support
- C. Reimport the key material from the original source outside of AWS to the existing KMS key.
- **D. Create new key material from the original source outside of AWS. Reimport the key material to the existing KMS key.**

Answer: D

Explanation:

When a KMS key with imported key material loses its material (e.g., due to expiration or deletion), it becomes unusable until new key material is reimported. The developer should regenerate or retrieve the original key material from the external source and reimport it to the same KMS key using the same key ID, restoring access to the encrypted data without needing re-encryption, which is the least effort solution.
