Salesforce Certified MuleSoft Associate Sample Questions (Q33-Q38):

NEW QUESTION # 33
According to MuleSoft which deployment characteristic applies to a microservices application architecture?

- A. All services of an application can be deployed together as single Java WAR file
- B. Services exist as independent deployment artifacts and can be scaled independently of other services
- C. Core business capabilities are encapsulated in a single deployable application
- D. A deployment to enhance one capability requires a redeployment of all capabilities

Answer: B

Explanation:
Microservices architecture is designed to enhance flexibility, scalability, and maintainability by decomposing applications into small, independent services. Here's a detailed explanation:
Independent Deployment:
Definition: Each microservice is developed, deployed, and managed independently. This allows teams to work on different services without interfering with each other.
Scalability: Services can be scaled independently based on demand, improving resource utilization and system resilience.
Benefits:
Flexibility: Enhances the ability to update or scale specific parts of an application without affecting the whole system.
Resilience: Isolates failures to individual services, preventing cascading failures across the entire application.
Technology Diversity: Allows the use of different technologies and languages best suited for each service.

Microservices Architecture: What are Microservices?
Benefits of Microservices: Microservices Characteristics

NEW QUESTION # 34
Which Exchange asset type represents a complete API specification in RAML or OAS format?

- A. SOAP APIs
- B. Connectors
- C. API Spec Fragments
- D. REST APIs

Answer: D

Explanation:
In Anypoint Exchange, a REST API asset represents a complete API specification in RAML (RESTful API Modeling Language) or OAS (OpenAPI Specification) format. Here's a detailed explanation:
REST APIs:
Definition: REST APIs are application programming interfaces that adhere to the principles of REST, allowing interaction with RESTful web services.
Specifications: Typically defined using RAML or OAS to describe the API's endpoints, methods, request/response structures, and security protocols.
Asset Types in Anypoint Exchange:
REST APIs: Represent the full API specification, including all necessary details for developers to understand and use the API.
SOAP APIs: Define APIs following the SOAP protocol, often using WSDL.
Connectors: Provide pre-built connectivity to various systems and services.
API Spec Fragments: Reusable pieces of an API specification, such as data types or security schemes, that can be included in full API specifications.
Usage:
Discoverability: Developers can easily discover, review, and reuse these API specifications in their projects.
Documentation: Provides comprehensive documentation generated from the API specification, ensuring consistency and clarity.
MuleSoft Documentation: REST APIs in Exchange
RAML and OAS: RAML, OpenAPI

NEW QUESTION # 35
An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.
Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Orchestration
- B. Aggregation
- C. Multicasting
- D. Streaming

Answer: A

Explanation:
In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:
Understanding Orchestration:
Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.
Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.
Order Processing API:
API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.
Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state

between steps, such as validating an order, creating it, and fulfilling it.
Implementation Steps:
Microservices Interaction: The order processing API interacts with various microservices:
Validation Microservice: Checks the validity of the order details.
Creation Microservice: Creates the order in the system.
Fulfillment Microservice: Manages the order fulfillment process.
Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.
MuleSoft Documentation: Orchestration Pattern
API-led Connectivity: MuleSoft API-led Connectivity

NEW QUESTION # 36
Which Anypoint Platform component helps integration developers discover and share reusable APIs, connectors and templates"?

- A. Anypoint Studio
- B. Anypoint Exchange
- C. API Manager
- D. Design Center

Answer: B

Explanation:
Anypoint Exchange is a component of the Anypoint Platform that helps integration developers discover and share reusable APIs, connectors, and templates. Here's a detailed explanation:
Anypoint Exchange:
Purpose: Acts as a centralized repository for discovering, sharing, and reusing APIs, connectors, templates, and other integration assets.
Discovery: Developers can search for and find existing APIs, connectors, and templates within the organization or from the wider MuleSoft community.
Sharing: Allows developers to publish their APIs and assets, making them available for reuse by others in the organization.
Benefits:
Reusability: Promotes reuse of existing assets, reducing development time and effort.
Collaboration: Facilitates collaboration and sharing of best practices among development teams.
Documentation: Provides comprehensive documentation and usage examples for each asset.
MuleSoft Documentation: Anypoint Exchange
Anypoint Platform Features: Discover and Share with Exchange

NEW QUESTION # 37
According to MuleSoft a synchronous invocation of a RESTful API using HTTP to gel an individual customer record from a single system is an example of which system integration interaction pattern?

- A. One-way
- B. Multicast
- C. Request-Reply
- D. Batch

Answer: C

Explanation:
In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:
Request-Reply Pattern:
Definition: This pattern involves a client sending a request to a server and waiting for a reply. The communication is synchronous, meaning the client waits for the server to process the request and send back the response.
Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.
RESTful API and HTTP:
Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.

Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.
Example:
Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.
MuleSoft Documentation: Integration Patterns
REST API Design: Request-Reply Pattern
