To pass the Amazon DVA-C02 Exam is a dream who are engaged in IT industry. If you want to change the dream into reality, you only need to choose the professional training. PassReview is a professional website that providing IT certification training materials. Select PassReview, it will ensure your success. No matter how high your pursuit of the goal, PassReview will make your dreams become a reality.

Amazon DVA-C02 certification exam is a valuable certification for individuals who want to advance their career in cloud computing. AWS Certified Developer - Associate certification demonstrates the candidate's expertise in AWS development and deployment, making them a valuable asset to any organization that uses AWS. Additionally, the certification provides individuals with a competitive advantage over their peers, making it easier for them to find better job opportunities and higher salaries.

To earn the AWS Certified Developer - Associate certification, candidates must pass the DVA-C02 Exam. DVA-C02 exam consists of multiple-choice and multiple-response questions that cover various topics, such as AWS core services, AWS databases, AWS security, AWS deployment, and AWS troubleshooting. DVA-C02 exam duration is 130 minutes, and the passing score is 720 out of 1000.

Once you have any questions about our DVA-C02 actual exam, you can contact our staff online or send us an email. We have a dedicated all-day online service to help you solve problems. Before purchasing, you may be confused about what kind of DVA-C02 guide questions you need. You can consult our staff online. After the consultation, your doubts will be solved and you will choose the DVA-C02 Learning Materials that suit you. Our online staff is professionally trained and they have great knowledge on the DVA-C02 exam questions to help you pass the DVA-C02 exam.

### Amazon AWS Certified Developer - Associate Sample Questions (Q411-Q416):

#### NEW QUESTION # 411

A company is using AWS SAM to develop a social media application. A developer needs a quick way to test AWS Lambda functions locally by using test event payloads. The developer needs the structure of these test event payloads to match the actual events that AWS services create.

Which solution will meet these requirements with the LEAST development effort?

- A. Store manually created test event payloads locally. Use the `sam local invoke` command with the file path to the payloads.
- B. Create shareable test Lambda events. Use these test Lambda events for local testing.
- **C. Use the `sam local generate-event` command to create test payloads for local testing.**
- D. Store manually created test event payloads in an Amazon S3 bucket. Use the `sam local invoke` command with the S3 path to the payloads.

**Answer: C**

Explanation:

AWS SAM provides built-in tooling to generate realistic event payloads that match the structure of events produced by AWS services (such as S3, SNS, SQS, API Gateway, EventBridge, and others). The command designed specifically for this purpose is `sam local generate-event`. It produces sample event JSON that mirrors the format AWS services deliver to Lambda, which meets the requirement that payload structures match real service events.

This approach also requires the least development effort because the developer does not need to manually craft and maintain JSON payload files. Instead, the developer can generate the appropriate event type with SAM, optionally tweak values (bucket name, object key, request parameters), and then run `sam local invoke` using the generated payload. This significantly reduces mistakes and saves time, especially when testing multiple event sources.

Why other options are less suitable:

- \* A (shareable test events) is vague and typically still requires manual creation/maintenance.
- \* B requires manually creating payloads, which is error-prone and higher effort.
- \* C adds unnecessary operational overhead (S3 storage) and still relies on manual payload creation.

Therefore, using `sam local generate-event` is the quickest and lowest-effort way to generate accurate AWS- service-like test payloads for local Lambda testing.

#### NEW QUESTION # 412

A company is building a serverless application on AWS. The application uses Amazon API Gateway and AWS Lambda. The company wants to deploy the application to its development, test, and production environments.

Which solution will meet these requirements with the LEAST development effort?

- A. Duplicate the code for each environment. Deploy the code to a separate API Gateway stage.
- B. Use AWS Elastic Beanstalk to deploy the application to the environments.
- C. Use Amazon ECS to deploy the application to the environments.
- **D. Use API Gateway stage variables and create Lambda aliases to reference environment-specific resources.**

**Answer: D**

#### NEW QUESTION # 413

A developer is building an application on AWS. The application has an Amazon API Gateway API that sends requests to an AWS Lambda function. The API is experiencing increased latency because the Lambda function has limited available CPU to fulfill the requests.

Before the developer deploys the API into production, the developer must configure the Lambda function to have more CPU.

Which solution will meet this requirement?

- **A. Increase the amount of memory that is allocated to the Lambda function.**
- B. Increase the timeout value of the Lambda function.
- C. Increase the ephemeral storage size of the Lambda function.
- D. Increase the virtual CPU (vCPU) cores quota of the Lambda function.

**Answer: A**

Explanation:

In AWS Lambda, CPU power scales proportionally with the memory configuration. Lambda does not let you directly set "CPU cores" as a standalone setting in the general case; instead, increasing the function's configured memory increases the CPU allocation (and other resources such as network throughput) available to the function. Therefore, to reduce latency caused by insufficient CPU, the developer should increase the function's memory setting.

Option B directly addresses the CPU limitation in the supported Lambda configuration model. This is a common performance tuning approach: raise memory, benchmark, and find the optimal cost/performance point.

Option A is not the right lever for most Lambda functions because Lambda compute is configured via memory (and architecture), not by directly raising a "vCPU quota" per function in a typical tuning workflow.

Option C increases /tmp storage capacity and helps when dealing with large temporary files, not CPU availability.

Option D increases the maximum runtime allowed per invocation, but it does not give the function more CPU and will not reduce latency caused by CPU starvation.

Therefore, increasing the allocated memory is the correct way to increase CPU for a Lambda function.

#### NEW QUESTION # 414

A developer is making changes to a custom application that uses AWS Elastic Beanstalk.

Which solutions will update the Elastic Beanstalk environment with the new application version after the developer completes the changes? (Select TWO.)

- A. Package the application code into a .zip file. Use the AWS Management Console to create a new application version from the .zip file. Rebuild the environment by using the AWS CLI.
- **B. Package the application code into a .zip file. Use the AWS CLI to create a new application version from the .zip file and to update the environment.**
- C. Package the application code into a .tar file. Use the AWS Management Console to upload the .tar file and deploy the packaged application.
- **D. Package the application code into a .zip file. Use the AWS Management Console to upload the .zip file and deploy the packaged application.**
- E. Package the application code into a .tar file. Use the AWS Management Console to create a new application version from the .tar file. Update the environment by using the AWS CLI.

**Answer: B,D**

#### NEW QUESTION # 415

A developer is creating a mobile application that will not require users to log in.

What is the MOST efficient method to grant users access to AWS resources'?

- **A. Use Amazon Cognito to associate unauthenticated users with an IAM role that has limited access to resources.**
- B. Use an identity provider to securely authenticate with the application.
- C. Create an AWS Lambda function to create an IAM user when a user accesses the application.
- D. Create credentials using AWS KMS and apply these credentials to users when using the application.

**Answer: A**

Explanation:

This solution is the most efficient method to grant users access to AWS resources without requiring them to log in. Amazon Cognito is a service that provides user sign-up, sign-in, and access control for web and mobile applications. Amazon Cognito identity pools support both authenticated and unauthenticated users. Unauthenticated users receive access to your AWS resources even if they aren't logged in with any of your identity providers (IdPs). You can use Amazon Cognito to associate unauthenticated users with an IAM role that has limited access to resources, such as Amazon S3 buckets or DynamoDB tables. This degree of access is useful to display content to users before they log in or to allow them to perform certain actions without signing up. Using an identity provider

to securely authenticate with the application will require users to log in, which does not meet the requirement. Creating an AWS Lambda function to create an IAM user when a user accesses the application will incur unnecessary costs and complexity, and may pose security risks if not implemented properly. Creating credentials using AWS KMS and applying them to users when using the application will also incur unnecessary costs and complexity, and may not provide fine-grained access control for resources.

## NEW QUESTION # 416

.....

Our company has authoritative experts and experienced team in related industry. To give the customer the best service, all of our company's DVA-C02 learning materials are designed by experienced experts from various field, so our DVA-C02 Learning materials will help to better absorb the test sites. One of the great advantages of buying our product is that can help you master the core knowledge in the shortest time. At the same time, our DVA-C02 Learning Materials discard the most traditional rote memorization methods and impart the key points of the qualifying exam in a way that best suits the user's learning interests, this is the highest level of experience that our most authoritative think tank brings to our DVA-C02 learning materials users.
