Splunk certificate is very important certificate, so more and more people choose to attend SPLK-2003 Certification Exam.

Splunk Phantom Certified Admin Sample Questions (Q59-Q64):

NEW QUESTION # 59
Which of the following are tabs of an asset configuration?

- A. Asset Name, Asset IP, Asset URL, Asset Nickname
- B. Asset Info, Asset Settings, Approval Settings, Access Control
- C. App Name, App Order, App Expiry, App Version
- D. Tags, Asset Name, Asset Date, Asset Order

Answer: B

Explanation:
In Splunk SOAR, the asset configuration consists of several key tabs that are essential for setting up and managing an asset. These tabs include:
* Asset Info: Contains general information about the asset, such as its name and description.
* Asset Settings: This tab allows for configuring specific settings related to the asset, including any connections or integrations.
* Approval Settings: This section manages settings related to the approval process for actions that require explicit authorization.
* Access Control: This tab helps control user access to the asset, specifying permissions and roles.
These four tabs are essential for configuring an asset in SOAR, making sure the asset works as expected and that the right people have access to it.

* Splunk SOAR Documentation: Asset Configuration.
* Splunk SOAR Best Practices: Asset Management and Configuration.

NEW QUESTION # 60
What is enabled if the Logging option for a playbook's settings is enabled?

- A. All modifications to the playbook will be written to the audit log.
- B. More detailed information is available in the debug window.
- C. More detailed logging information Is available m the Investigation page.
- D. The playbook will write detailed execution information into the spawn.log.

Answer: C

Explanation:
Explanation
The Logging option for a playbook's settings enables more detailed logging information to be available in the Investigation page. This can help with debugging and troubleshooting the playbook execution. The other options are not related to the Logging option. See Playbook settings for more information.

NEW QUESTION # 61
Which of the following are examples of things commonly done with the Phantom REST APP

- A. Use Django queries; use curl to create a container and add artifacts to it; add action blocks.
- B. Use Django queries; use Docker to create a container and add artifacts to it; remove temporary lists.
- C. Use Django queries; use curl to create a container and add artifacts to it; remove temporary lists.
- D. Use SQL queries; use curl to create a container and add artifacts to it; remove temporary lists.

Answer: C

Explanation:
Explanation
The correct answer is A because using Django queries, using curl to create a container and add artifacts to it, and removing temporary lists are examples of things commonly done with the Phantom REST APP. The Phantom REST APP is a built-in app that allows you to interact with the Phantom server using REST API calls. You can use the run query action to execute Django queries on the Phantom database and return the results as JSON. You can use the curl command to send HTTP requests to the Phantom server and perform various operations, such as creating containers, adding artifacts, running playbooks, etc. You can use the remove list action to delete temporary lists that are no longer needed. See Splunk SOAR Documentation for more details.

NEW QUESTION # 62
Which of the following is the complete list of the types of backups that are supported by Phantom?

- A. Full backups.
- B. Full and incremental backups.
- C. Full and delta backups.
- D. Full, delta, and incremental backups.

Answer: B

NEW QUESTION # 63
Two action blocks, geolocate_ip 1 and file_reputation_2, are connected to a decision block. Which of the following is a correct configuration for making a decision on the action results from one of the given blocks?

- A. ▯
- B. ▯
- C. ▯
- D. ▯

Answer: B

Explanation:
In the given decision block, you are trying to evaluate the results of two action blocks: geolocate_ip_1 and file_reputation_2. The correct configuration for making a decision based on the result of geolocate_ip_1 is by checking the country_iso_code field from the action result and setting the evaluation option to != (not equal), with no specific value provided in the "Select Value" box. This essentially checks whether a valid country ISO code exists in the action result and proceeds if it's not empty or different from a specific value. This is a common check when working with geolocation results to see if a response has been returned.
Other options (B, C, and D) include response codes or list comparisons, which do not align with the decision structure mentioned, which needs to operate based on a country_iso_code field.
