Professional JN0-105 Reliable Exam Pattern & Passing JN0-105 Exam is No More a Challenging Task

Since it is obvious that different people have different preferences, we have prepared three kinds of different versions of our JN0-105 practice test, namely, PDF version, Online App version and software version. Last but not least, our customers can accumulate exam experience as well as improving their exam skills in the mock exam. There is no limitation on our software version of JN0-105 practice materials about how many computers our customers used to download it, but it can only be operated under the Windows

operation system. I strongly believe that you can find the version you want in multiple choices of our JN0-105 practice test.

Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q49-Q54):

NEW QUESTION # 49

Exhibit

```
{hold:node0};[edit]
```

```
root# set system root-authentication ?
```

Possible completions:

+ apply-groups Groups from which to inherit configuration data

+ apply-groups-except Don't inherit configuration data from these groups encrypted-password Encrypted password string load-key-file File (URL) containing one or more ssh keys plain-text-password Prompt for plain text password (autoencrypted)

> ssh-dsa Secure shell (ssh) DSA public key string

> ssh-rsa Secure shell (ssh) RSA public key string

```
{hold:node0};[edit]
```

```
root# set system root-authentication plain-text-password
```

New password:

Retype new password:

```

```

```
'ge-0/0/0'
```

HA management port cannot be configured

error: configuration check-out failed

```
{hold:node0};[edit]
```

```
root#
```

You are unable to remotely access your Juniper device using the CLI.

Referring to the exhibit, which command would you add to the existing configuration to enable remote CLI access?

- A. set system root-authentication plain-text-password
- B. load factory-default
- C. set system login idle-timeout 20
- D. set system services ssh

Answer: D

Explanation:

In Junos OS, remote access to the device's CLI is commonly facilitated through Secure Shell (SSH), a protocol providing secure command-line access over an insecure network. The given exhibit indicates an attempt to set a root authentication password but does not show configuration for enabling remote access services. To enable SSH, which is not shown in the configuration snippet, you need to configure the device to accept SSH connections. This is done by enabling the SSH service within the system services hierarchy of the configuration. The correct command to add to the existing configuration for enabling remote CLI access via SSH is set system services ssh. This command activates the SSH service, allowing secure remote logins to the device.

NEW QUESTION # 50

Exhibit

```
user@router> show route 192.168.100.2
```

```
inet.O: 15 destinations, 17 routes (15 active, 0 holddown, 0 hidden) Limit/Threshold: 1048576/1048576 destinations
```

```
+ = Active Route, - = Last Active, * = Both 192.168.100.2/32*[OSPF/IO] 00:14:29, metric 1
```

```
> to 172.16.1.6 via ge-0/0/1.0 [BGP/170] 00:06:49, localpref 100
```

```
AS path: 65102 I, validation-state: unverified > to 172.16.1.6 via ge-0/0/1.0 Referring to the exhibit, which statement is correct?
```

- A. The OSPF path is the only active route.
- B. / Traffic is load-balanced across two routes.
- C. The BGP route is preferred over the OSPF route.
- D. The BGP path is the only active route.

Answer: A

Explanation:

Referring to the exhibit, the presence of the "+" symbol next to the OSPF route for 192.168.100.2/32 indicates that this is the active route being used to forward traffic. The BGP route, although present, does not have the "+" symbol, indicating it is not the active route. In Junos OS, the routing table displays the active route with a "+" symbol, and the fact that the OSPF route has this symbol means it is the preferred path based on the routing protocol's decision process, which takes into account factors such as route preference (administrative distance) and metrics.

NEW QUESTION # 51

Which two statements are true about the Junos OS? (Choose two.)

- A. Routing tables are stored in the control plane.
- B. Exception traffic is never sent to the control plane.
- C. Exception traffic is sent to the control plane.
- D. Routing tables are stored in the forwarding plane.

Answer: A,C

Explanation:

In Junos OS, as with many network operating systems, the control plane is responsible for processes that determine how to route traffic. This includes maintaining routing tables, which store information about network paths and protocols. Therefore, routing tables are indeed stored in the control plane.

Exception traffic refers to packets that cannot be processed by the normal fast-path processing of the Packet Forwarding Engine (PFE) in the forwarding plane, and thus are sent to the control plane for further processing.

This might include packets destined for the router itself, packets that need to be fragmented, or packets that match certain firewall filter criteria, among other reasons.

Routing tables are not stored in the forwarding plane. However, the forwarding plane contains the forwarding table (sometimes referred to as the forwarding information base or FIB), which is a distilled version of the routing table optimized for fast packet forwarding. The forwarding plane uses this information to perform the actual transfer of packets across the network device interfaces.

NEW QUESTION # 52

Exhibit

```
term limit-icmp { from {
source-address {
172.25.11.0/24;
}
}
protocol icmp;
}
then {
count count-icmp; discard;
}
}
```

Referring to the exhibit, which two actions will occur when a packet matches the firewall filter? (Choose two.)

- A. The packet will be forwarded.
- B. The packet will be discarded.
- C. A counter will be incremented.
- D. An ICMP destination unreachable message will be returned.

Answer: B,C

Explanation:

Referring to the firewall filter configuration in the exhibit, when a packet matches the specified term `limit-icmp`, two actions are defined in the `then` statement: `count count-icmp` and `discard`. The `count count-icmp` action means that each time a packet matches this term, a counter named `count-icmp` will be incremented, providing a tally of how many packets have matched the term. The `discard` action means that the packet will be dropped and not forwarded through the device. This effectively prevents the packet from reaching its intended destination. There is no action specified that would cause an ICMP destination unreachable message to be returned, nor is there any action that would allow the packet to be forwarded.

NEW QUESTION # 53

How many login classes are assignable to a user account?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

<https://www.juniper.net/documentation/us/en/software/junos/user-access-evo/user-access/topics/topic-map/junos-os-login-class.html#:~:text=You%20can%20define%20any%20number,to%20an%20individual%20user%20account.>

In Junos OS, each user account can be assigned only one login class. Login classes in Junos OS define the permissions for users, controlling what they can access and modify within the system. This setup helps in maintaining a clear and secure access control mechanism.
