#### NEW QUESTION # 25

Which of the following is NOT a function of Nokia's SR Linux application manager?

- A. It translates the application's YANG model into protobufs for the IDB.
- B. It manages the SR Linux and customer-defined applications.
- C. It reads the application's configuration information and starts each application.
- D. It monitors the health of all applications.

**Answer: A**

#### NEW QUESTION # 26

Which of the following is NOT one of the reasons why BGP is used as the routing protocol in the data center?

- A. BGP neighbors automatically discover each other.
- B. It is more efficient than link-state protocols like IS-IS and OSPF.
- C. It supports both IPv4 and IPv6.
- D. It is a well understood and mature routing protocol.

**Answer: B**

Explanation:

BGP is not chosen because it is more efficient than link-state protocols; in fact, link-state protocols like IS-IS and OSPF generally provide faster convergence and more efficient route calculation. BGP is used in data centers mainly because it is mature, well understood, supports both IPv4 and IPv6, and offers flexible policy control.

#### NEW QUESTION # 27

Which of the following statements about Nokia's Fabric Services System is FALSE?

- A. Data center fabric configuration is represented as the fabric intent in a declarative YAML format.
- B. Digital sandbox provides notification of performance issues in the data center fabric.
- C. Telemetry data is provided in a context that is relevant to the fabric intent.
- D. Cloud-native design enables easy integration with the customer's environment.

**Answer: B**

The Digital Sandbox in Nokia's Fabric Services System is primarily used for simulation and validation of fabric intent, not for providing notifications of performance issues.

#### NEW QUESTION # 28

Which of the following is NOT how prefixes are typically learned and advertised in a leaf and spine data center?

- A. Spine routers learn prefixes from leaf routers directly using eBGP.
- B. Each leaf router advertises the prefixes of its own locally connected servers.
- C. Spine routers advertise learned prefixes to leaf routers directly using eBGP.
- **D. Each leaf router learns the prefixes of remote servers from other leaf routers directly using eBGP.**

**Answer: D**

Explanation:

Leaf routers do not learn prefixes from other leaf routers directly using eBGP; instead, leaf routers learn remote prefixes via spine routers. The spine acts as the route reflector or intermediary between leaf routers.
