WGU Cloud Deployment and Operations Sample Questions (Q36-Q41):

NEW QUESTION # 36

(Which AWS service is used to provide remote workers with secure access to AWS resources?)

- A. NAT instance
- B. Network Firewall
- **C. Client VPN**
- D. Transit Gateway

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

AWS Client VPN is used to provide remote workers with secure access to AWS resources by establishing a VPN connection to the VPC, ensuring encrypted access to private networks. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Client VPN) states, "Client VPN enables secure remote access to AWS resources within a VPC, using mutual authentication and encryption to protect data for remote workers." Transit Gateway manages inter-VPC routing, Network Firewall filters traffic, and NAT instances handle outbound internet access, none of which are designed for remote worker access.

NEW QUESTION # 37

(What can AWS Config directly invoke to cause remediation of findings?)

- A. Control Tower guardrail
- **B. Lambda function**
- C. Systems Manager document
- D. CloudWatch alarm

Answer: B

Explanation:

AWS Config can directly invoke an AWS Lambda function to cause remediation of findings by triggering automated responses to configuration changes or non-compliant resources. This integration enables real-time corrective actions. The WGU Cloud Deployment and Operations Study Guide (Section 6.1, AWS Config) states, "AWS Config can invoke a Lambda function as a remediation action, allowing automated fixes for non-compliant resources (e.g., terminating unauthorized instances)." Control Tower guardrails, CloudWatch alarms, and Systems Manager documents are not directly invoked by Config for this purpose.

NEW QUESTION # 38

(What should be configured in Systems Manager to set the error threshold for automation documents?)

- A. Session preferences

- B. Resource group
- C. Maintenance windows
- **D. Rate control**

Answer: D

Explanation:

In AWS Systems Manager, the error threshold for automation documents is configured using rate control.

Rate control allows administrators to define the maximum number of errors or concurrent executions that can occur before an automation task is throttled or stopped, ensuring system stability. The WGU Cloud Deployment and Operations Study Guide (Section 5.1, Systems Manager Automation) explicitly states, "Rate control settings in Automation documents can be used to specify the maximum number of errors allowed during execution, helping to manage error thresholds effectively." Resource groups, session preferences, and maintenance windows do not directly address error thresholds.

NEW QUESTION # 39

(What is the role of a patch baseline in Patch Manager?)

- A. Notifies Config of any patch updates that need to be performed
- **B. Defines patches that should and should not be installed on EC2 instances**
- C. Assigns an IAM role for services that can auto-approve patches upon release
- D. Installs all patch updates as they become available by default

Answer: B

Explanation:

A patch baseline in Patch Manager defines the patches that should and should not be installed on EC2 instances, specifying approval rules for security updates, other updates, and exclusions. This ensures controlled and compliant patching. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "A patch baseline specifies which patches are approved for installation and which are excluded, allowing customization of patch deployment (e.g., approving only critical security updates)." Options A, B, and D misrepresent the baseline's role, as it does not auto-install, assign IAM roles, or notify Config directly.

NEW QUESTION # 40

(Which CloudWatch metric filter includes log events with the word ERROR but excludes log events with the word WARNING?)

- A. ERROR WARN
- B. "ERROR" WARN
- C. ?ERROR ?WARN
- **D. ERROR -WARN**

Answer: D

Explanation:

A metric filter in Amazon CloudWatch Logs can be used to search for specific terms in log data and create metrics based on the matches. To include log events with the word "ERROR" and exclude those with the word "WARNING," the correct syntax involves using a filter pattern with a positive match for "ERROR" and a negation for "WARNING." The correct pattern is "ERROR -WARN," where the minus sign (-) indicates exclusion of log events containing "WARN." According to the WGU Cloud Deployment and Operations Study Guide (Section 4.2, CloudWatch Logs), metric filters use a pattern-based syntax where terms are included or excluded using positive matches and the negation operator (-). This ensures that only logs with "ERROR" and without "WARN" are processed into the metric.
