連絡先が挿入されると、連絡先のアドレス情報に基づいて、カスタム メタデータ レコードから連絡先にデフォルト情報が設定される必要があります。

さらに、ユーザーがフラグが設定された領域に属する連絡先を削除しようとする、エラー メッセージが表示されます。

企業の人事リソースに応じて、これを自動化する 2 つの方法は何ですか?

2 つの答えを選択してください

- A. リモートアクション
- B. Apex 呼び出し可能なメソッド
- C. 頂点トリガー
- D. フロービルダー

Answer: C,D

Explanation:

The two ways to automate this process are to use Flow Builder and Apex trigger. Flow Builder is a tool that allows the developer to create declarative workflows that can perform logic, manipulate data, and interact with the Salesforce database. The developer can use Flow Builder to create a record-triggered flow that runs when a contact is inserted, and set the default information on the contact from the custom metadata records based on the contact's address information. The developer can also use Flow Builder to create a before-delete flow that runs when a user attempts to delete a contact, and display an error message if the contact belongs to a flagged region. Apex trigger is a code-based solution that allows the developer to execute Apex logic when a record is inserted, updated, deleted, or undeleted. The developer can use Apex trigger to create an after-insert trigger on Contact that queries the custom metadata records and sets the default information on the contact from the matching record based on the contact's address information. The developer can also use Apex trigger to create a before-delete trigger on Contact that queries the custom metadata records and throws an exception if the contact belongs to a flagged region. Remote action is not a valid answer, as it is a method that allows the developer to invoke an Apex controller method from a Visualforce page using JavaScript, but it does not automate the process. Apex invocable method is not a valid answer, as it is a method that allows the developer to expose an Apex method to a process, such as a flow or a process builder, but it does not automate the process by itself. - A. Salesforce Lightning Inspector イベントログタブ34
- B. Salesforce Lightning Inspector アクションタブ56
- C. Salesforce Lightning Inspector トランザクションタブ78
- **D. Salesforce Lightning Inspector ストレージタブ12**

Answer: D

Explanation:

Comprehensive and Detailed 150 to 25110 words of Explanation:

The Salesforce Lightning Inspector is a Chrome DevTools extension used to investigate and optimize Lightning components. When a page fails to show the most current reference data, the issue often lies within the client-side caching mechanism. The Storage tab (A) is specifically designed to help developers inspect the client-side data stores used by the Lightning Data Service (LDS) and custom component caching.

In this tab, a developer can view the contents of the various storage caches (such as actions, records, and lists). It allows the developer to see exactly what data is currently stored in the cache, its expiration time, and whether the data is being retrieved from the server or served directly from the cache. By analyzing the Storage tab, a developer can determine if a component is incorrectly holding onto "stale" data instead of refreshing from the server.

The Actions tab (C) is useful for monitoring the status of server-side controller actions, and the Event Log (B) tracks the sequence of application and component events. However, for a data consistency issue specifically related to caching, the Storage tab provides the most direct visibility into the underlying cause. Using this tool, a developer can verify if the cache invalidation logic is working correctly or if the storage limits are causing unexpected data eviction.
