Salesforce Order Management Administrator Accredited Professional 認定 Order-Management-Administrator 試験問題 (Q44-Q49):

質問 # 44

Which objects can a Process Exception be related to?

- A. Order Details, Fulfillment Order, Payment Invoice
- B. Order Summary, Fulfillment Order, Payment Invoice
- C. Order Summary, Order Details, Fulfillment Order
- **D. Order Summary, Fulfillment Order**

正解: D

質問 # 45

An administrator has created a flow but during testing they encounter an unhandled fault error. Which three can the administrator do to get more details for debugging?

- A. Add a screen node
- **B. Add a Display Text component which includes {! \$Flow.FaultMessage}**
- **C. Create an error connector**
- D. Add an error node
- **E. Create a fault connector**

正解: B、C、E

解説:

Explanation

Three things that the administrator can do to get more details for debugging when encountering an unhandled fault error are:

Create a fault connector. A fault connector is a special type of connector that handles errors that occur in a flow element, such as an assignment, a loop, or an action. A fault connector can route the flow to another element or end the flow with an error message.

Add a Display Text component which includes {! \$Flow.FaultMessage}. A Display Text component is a screen component that displays text on a screen element in a flow. The {! \$Flow.FaultMessage} is a system variable that contains information about the error that occurred in the flow, such as the element name, error type, and error message.

Create an error connector. An error connector is a special type of connector that handles errors that occur in a screen element, such as invalid user input or required fields being left blank. An error connector can route the flow to another screen element or end the flow with an error message.

質問 # 46

An administrator is attempting to deploy a Change Set from a development org to a test org but the test org is not available in the list of target organizations. What are two reasons that could cause this issue?

- **A. The components in the Change set could not be found within the test org**
- B. Change Sets can only be deployed from a sandbox org to a production org, not another sandbox org.
- **C. The development org has not been approved to upload Change Sets from within the test org**
- **D. The development org and test org are not associated with the same production org.**

正解: A、C

解説:

Explanation

Two possible reasons that could cause the test org to not appear in the list of target organizations are:

The components in the Change set could not be found within the test org. This means that the test org does not have the same metadata components or features as the development org, and therefore cannot receive the change set.

The development org has not been approved to upload Change Sets from within the test org. This means that there is no deployment

connection between the two orgs, and the test org has not authorized the development org to send change sets to it.

質問 # 47

A company has an external system that stores client accounting data but they want to be able to search for this data within Salesforce. What three steps should the administrator take to implement this functionality?

- A. Create an External Data Source pointing to the external system's database
- B. Create an automated data capture (or the external system)
- C. Create an Indirect Lookup field to connect to the Account
- D. Create an automated import of the external data using the Job Scheduler
- E. Create an External Object for each table of accounting data in the external system

正解: A、C、E

解説:

Explanation

Three steps that the administrator should take to implement this functionality are:

Create an External Data Source pointing to the external system's database. An External Data Source is a type of metadata that defines the connection and authentication information for an external system that stores data outside of Salesforce. The administrator can create an External Data Source using the Lightning Connect OData 2.0 or 4.0 adapters, which support read-only access to data in relational databases.

Create an External Object for each table of accounting data in the external system. An External Object is a type of custom object that maps to a table in an external system. The administrator can create an External Object for each table of accounting data that they want to access from Salesforce, and define its fields and relationships accordingly.

Create an Indirect Lookup field to connect to the Account. An Indirect Lookup field is a type of custom field that links a child External Object record to a parent standard or custom object record. The administrator can create an Indirect Lookup field on the External Object that references the Account object, and specify the external column name and value that match the Account ID.

質問 # 48

A developer needs to create a scheduled job in an external system to move Order data into a Salesforce org every 24 hours. In which two ways can this off-platform job be established without additional third-party tools?

- A. Authorize a machine against the Salesforce org's APIs with appropriate security measures and create a script to call the APIs
- B. Install a minimal set of dev tools on a machine such as the Command Line Interface (CLI) and create appropriate scripts to import files containing the data
- C. Create a job in the org (on-platform) to drop a file of existing data. Use the off-platform machine to generate a file and identify the details between the two. Push the changes to the org's "Import" directory
- D. Set up an SFTP server as a waystation. drop the files there using the off-platform job and schedule a job in-platform to process the file

正解: A、B

解説:

Two ways that this off-platform job can be established without additional third-party tools are:

Install a minimal set of dev tools on a machine such as the Command Line Interface (CLI) and create appropriate scripts to import files containing the data. The CLI is a tool that allows developers to interact with Salesforce from the command line. The developer can use the CLI to create scripts that use commands such as `force:data:bulk:upsert` or `force:data:tree:import` to import data from CSV or JSON files into Salesforce.

Authorize a machine against the Salesforce org's APIs with appropriate security measures and create a script to call the APIs. The APIs are interfaces that allow developers to access data and functionality in Salesforce from external systems. The developer can use the APIs, such as REST API or Bulk API, to create a script that authenticates with Salesforce using OAuth 2.0 or JWT, and then performs operations such as insert, update, or delete on Order data.
