UiPath Certified Professional Agentic Automation Associate (UiAAA) 認定 UiPath-AAAv1 試験問題 (Q60-Q65):

質問 #60
What configuration options are available for setting up Context Grounding in UiPath?

- A. Context Grounding requires default settings without any options for index creation or LLM selection.
- B. Context Grounding setup relies entirely on manual indexing and lacks automated sync capabilities.
- C. You can configure Context Grounding by creating indexes in Orchestrator, managing folder-level permissions, selecting an LLM from the LLM Gateway, and syncing data using the Update Context Grounding Index activity.
- D. Configuration is limited to enabling Context Grounding without any integration with Orchestrator or folder permissions.

正解：C

解説：
Bis correct - UiPath providesend-to-end configuration capabilitiesforContext Grounding, including:
* Creating indexesin Orchestrator
* Controlling accessviafolder-level permissions
* Selecting LLMsfrom theLLM Gateway
* Keeping indexesup to dateusing theUpdate Context Grounding Index activity This allows agents to accessreal-time enterprise context, reducing hallucinations and enhancing accuracy when performing actions or generating responses.
Option A underestimates the feature scope.
C and D are incorrect - UiPath supportsautomated syncs, granular access control, andmulti-model compatibility.
UiPath's platform treats grounding as agoverned, scalable enterprise feature, critical for AI safety and relevance.

質問＃61
When passing runtime data into an Agent, which approach ensures the input argument is actually available inside the user prompt at execution time?

- A. Declare the argument in the system prompt; any text surrounded by angle brackets (e.g., <CUSTOMER_EMAIL>) will be substituted automatically.
- B. Use single braces like {CUSTOMER_EMAIL}, because the platform automatically normalizes the identifier.
- C. Create the argument in Data Manager and reference it verbatim inside double curly braces, e.g., {{CUSTOMER_EMAIL}}, so the name matches exactly.
- D. Simply mention the variable name in plain prose-the Agent will infer the value from the workflow without special syntax.

正解：C

解説：
Bis correct - to pass runtime values into an agent's prompt in UiPath, you must:
* Declare the variable inData Manager
* Reference it inside theuser/system promptusingdouble curly braces, e.g., {{CUSTOMER_EMAIL}} This ensures the platform can:
* Substitute values at runtime
* Maintain traceability between arguments and prompts
* Provide context grounding for the LLM
Option A is incorrect - angle brackets are not used for substitution.
C is wrong - single braces {} are not valid for UiPath's binding syntax.
D is unreliable - LLMs do not infer values from prose without structured substitution.
This technique ensures consistentparameter injectionfor context-aware agent behavior.

質問＃62
A business is looking to automate its workflows and has both structured, repetitive tasks (like data entry) and unstructured, exception-heavy processes (such as responding to diverse customer queries). How should they combine agents and robots (RPA) to achieve optimal automation results?

- A. Use agents exclusively, as they can cover both structured workflows and dynamic environments due to their probabilistic and adaptive nature.
- B. Use agents for the structured, repetitive tasks, as they can follow deterministic rules efficiently while robots (RPA) handle unstructured workflows requiring adaptability, decision-making capabilities and contextual awareness.
- C. Use robots (RPA) exclusively, as they are capable of adapting to dynamic workflows with exception handling and learning capabilities.
- D. Use robots (RPA) for the structured, repetitive tasks, leveraging their rule-based approach for reliability and precision, while agents handle the unstructured processes by using their adaptive decision-making capabilities.

正解：**D**

解説：

Ais the correct andUiPath-recommended approach:

* RPA botsare ideal forstructured, rule-based, high-volume tasks- like data entry, file manipulation, system integration - wherepredictability and speedare key.

* Agentic AIexcels inunstructured, human-like decision scenarios - likeinterpreting emails,triaging support requests, orresponding to exceptionsusing LLMs and contextual memory.

UiPath promotes ahybrid automation model:

* Letrobotshandle deterministic workflows.

* Letagentsmanage ambiguity, natural language, and decision-making.

* Lethumanshandle escalations or approvals when required.

This createsscalable, intelligent, and efficientworkflows that combine strengths from both systems.

B and C are incorrect because neither agents nor bots alone are sufficient across all use cases.

D reverses the design logic - agents arenotbest for structured tasks; RPA is.

This hybrid approach is foundational in UiPath'sAgentic Orchestration and Co-Pilotstrategies, ensuring right-tool-for-the-taskautomation at scale.

質問 # 63

Which of the following best describes a challenge faced by traditional automation in complex business processes?

- A. Excessive flexibility in handling varied workflows across different systems like CRM and ERP
- B. Limited ability to automate unstructured tasks that require judgment and contextual awareness
- C. Over-reliance on AI-powered agents for all types of automation tasks
- D. Inability to perform repetitive, structured tasks efficiently and reliably

正解：**B**

解説：

The correct answer isC, which highlights one of the core limitations of traditional rule-based automation (RPA) - itsinability to handle unstructured tasks that require human-like reasoning and contextual awareness.

According to UiPath's Agentic Automation documentation, traditional automation excels atrepetitive, rules- based, structuredtasks. However, it struggles when:

* Input data isunstructured(like emails, PDFs, or chat logs)

* Tasks requirecontextual understanding, decision-making, or judgment

* Processes span across systems with unpredictable flows (e.g., CRM + ERP + email) This is exactly whereAgentic Automationsteps in. It augments classic automation by embeddingLLMs, AI agents, and decision intelligenceto manage tasks involving ambiguity, variability, and natural language - things traditional bots cannot handle well.

Options A, B, and D are incorrect or misleading:

* A is false because traditional automation isnotflexible across varied workflows.

* B is theoppositeof traditional automation - it's agentic.

* D is inaccurate because RPA handles repetitive, structured tasks very well - that's its strength.

By addressing C, UiPath bridges the gap between deterministic automation and intelligent, adaptive systems that can trulyscale across complex, real-world business scenarios.

質問 # 64

Why is it important to include examples in prompts?

- A. Including examples should only focus on edge cases while ignoring typical scenarios for better variety in results.
- B. Carefully chosen examples help guide the agent and improve its ability to generalize across different scenarios.
- C. Examples should be omitted to allow the AI to create responses entirely from general knowledge without guidance.
- D. Including examples guarantees output accuracy without any need for further adjustments or refinements.

正解：**B**

解説：

Dis correct - includingwell-designed examplesin prompts is a key part offew-shot learning, which helps LLM-based agents better understand thetask structure, output style, and expected behavior.

UiPath encourages the use of examples for:

* Classification(e.g., labeling sentiment, email categories)
* Transformation tasks(e.g., turning unstructured text into tables)
* Step-by-step instructions(e.g., troubleshooting flows)
These examples serve two purposes:
* Pattern induction: The model picks up on consistent structures or rules used across examples.
* Generalization: With diverse examples, the agent can apply logic to unseen but similar cases.
Best practice:
* Usetypical, real-world examplesrepresentative of the data the agent will encounter.
* Keep formatsclear and consistentacross input-output pairs.
* Pair examples withexplicit instructionsin the system or user prompt.
Option A is flawed - focusing only on edge cases can confuse the model.
B is false - omitting examples forces the LLM to guess the structure, reducing accuracy.
C is misleading - examples improve performance butdo not guarantee perfect output; testing and evaluation are still required.
In short,prompt engineering with examples is essentialto buildingreliable, generalizable, and scalableAI agents.
