Pass-sure AP-202 Study Materials are the best AP-202 exam dumps - Exam4Tests

The AP-202 exam questions that Exam4Tests provide with you is compiled by professionals elaborately and boosts varied versions: PDF version, Soft version and APP version, which aimed to help you pass the AP-202 exam by the method which is convenient for you. Our AP-202 training braindump is not only cheaper than other dumps but also more effective. The high pass rate of our AP-202 study materials has been approved by thousands of candidates, they recognized our website as only study tool to pass AP-202 exam.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q16-Q21):

NEW QUESTION # 16

What are three ways to test the value of Page Label on any Salesforce B2B Commerce Community Page? (3 answers)

- A. Execute CCRZ.pagevars.pageLabels['PAGE_LABEL_NAME'] in the JavaScript console.
- B. Execute CCRZ.processPageLabelMap('PAGE_LABEL_NAME') in the JavaScript console.
- C. Execute ('PAGE_LABEL_NAME') in the JavaScript console
- D. Access the source HTML for the page via the browser developer tools.
- E. Enable the 'display page label names' in cc admin.

Answer: A,B,E

Explanation:

Three ways to test the value of Page Label on any Salesforce B2B Commerce Community Page are:

Execute CCRZ.pagevars.pageLabels['PAGE_LABEL_NAME'] in the JavaScript console. This will return the value of the page label with the given name from the pagevars object, which contains all the page labels that are used on the page.

Execute CCRZ.processPageLabelMap('PAGE_LABEL_NAME') in the JavaScript console. This will return the value of the page label with the given name from the pageLabelMap object, which contains all the page labels that are defined in CCAdmin.

Enable the 'display page label names' in cc admin. This will display the name of each page label next to its value on the storefront pages, which can help identify and verify the page labels. [Salesforce B2B Commerce and D2C Commerce Developer Guide](#), [Page Labels](#)

NEW QUESTION # 17

A user wants to leverage a three column layout on a page. The user also wants to move the mini-cart widget from the right to the center column. How can this requirement be fulfilled?

- A. Page Include
- B. HandleBar Template Override
- C. Subscriber Template
- D. **Gross Layout Override**

Answer: D

Explanation:

To leverage a three column layout on a page and move the mini-cart widget from the right to the center column, the requirement can be fulfilled by creating a Gross Layout Override. This is a custom Visualforce page that overrides the default layout of a page and allows changing its structure and content. The user can create a Gross Layout Override that uses a three column layout and places the mini-cart widget in the center column. NEW QUESTION # 18

A developer is working on a storefront that needs to use a sophisticated pricing engine hosted as a service outside the org. Assuming security and trusts have been established, which two actions must the developer take?

- A. **Implement the sfdc_checkout.PriceCalculations**
- B. Use External Objects
- C. **Make a call to the service**
- D. Implement the sfdc_checkout.CartPriceCalculations

Answer: A,C

Explanation:

The correct answer is A and C. To use a sophisticated pricing engine hosted as a service outside the org, the developer must make a call to the service and implement the sfdc_checkout.PriceCalculations interface. The sfdc_checkout.PriceCalculations interface is a standard interface that defines the methods for calculating prices for a cart or an order. The developer can use this interface to override the default pricing logic and integrate with an external pricing service. The developer must also make a call to the external service using Apex REST or SOAP callouts and handle the response data accordingly.

Use External Objects and Implement the sfdc_checkout.CartPriceCalculations are not the correct answers. External objects are a way to access data from external data sources in real time, but they are not suitable for integrating with a pricing service that requires dynamic calculations. The sfdc_checkout.CartPriceCalculations interface is a deprecated interface that was used for calculating prices for a cart only. It has been replaced by the sfdc_checkout.PriceCalculations interface, which supports both carts and orders. Reference:

NEW QUESTION # 19

Which wire adapter should a developer use to retrieve metadata about a specific object?

- A. getObjectDescribe
- B. getObject
- C. **getObjectInfo**
- D. getObjectMetadata

Answer: C

Explanation:

To retrieve metadata about a specific object, a developer should use the getObjectInfo wire adapter. The getObjectInfo wire adapter imports data from the @salesforce/schema module and returns an object that contains information such as the object's label, key prefix, fields, child relationships, record type infos, and theme. The getObjectMetadata wire adapter does not exist. The getObject wire adapter does not retrieve metadata, but rather returns a record object based on the record ID. The getObjectDescribe wire adapter does not exist either. Salesforce [Lightning Web Components Developer Guide: getObjectInfo], [Lightning Web Components Developer Guide: Import Salesforce Schema]

NEW QUESTION # 20

Which Global JavaScript Object should be extended when writing custom Remote Actions?

- A. CCRZ.cc_Context
- B. **CCRZ.cc**
- C. CCRZ.RemoteInvocation
- D. CCRZ.

Answer: B

Explanation:

The Global JavaScript Object that should be extended when writing custom Remote Actions is CCRZ.cc. This object contains all the Remote Actions that are defined in the cloudcraze managed package, which can be overridden or extended by subscriber code. The object also provides a mechanism for registering custom Remote Actions that can be invoked by the user interface components. For example, CCRZ.cc.customAction = function(params, callback){ // do something } will define a custom Remote Action named customAction that can be called by CCRZ.cc.customAction(params, callback).
