Training Deep-Security-Professional Material - Deep-Security-Professional Updated CBT

The PDFTorrent is offering real and updated Trend Deep-Security-Professional practice test questions. Very easy to use and perfectly assist you in Trend Deep-Security-Professional exam preparation. Trend Deep-Security-Professional Exams and will give you real-time Trend Deep-Security-Professional exam preparation environment all the time.

Trend Micro Certified Professional for Deep Security Sample Questions (Q30-Q35):

NEW QUESTION # 30
The "Protection Source when in Combined Mode" settings are configured for a virtual machine as in the exhibit. You would like to enable Application Control on this virtual machine, but there is no corresponding setting displayed. Why?

- A. In the example displayed in the exhibit, the Application Control Protection Module has not yet been enabled. Once it is enabled for this virtual machine, the corresponding settings are displayed.
- B. In the example displayed in the exhibit, no activation code was entered for Application Control. Since the Protection Module is not licensed, the corresponding settings are not displayed.
- C. These settings are used when both a host-based agent and agentless protection are available for the virtual machine. Since Application Control is not supported in agentless installations, there is no need for the setting.
- D. In the example displayed in the exhibit, the VMware Guest Introspection Service has not yet been installed. This service is required to enable Application Control in agentless installations.

Answer: C

Explanation:

The "Protection Source when in Combined Mode" configuration appears only for features supported in both agent-based and agentless (VMware NSX) modes.

Application Control is not available in agentless installations-it is only supported with host-based (agent) deployment. Therefore, there is no setting for Application Control in this combined mode view, as agentless protection cannot provide this module.

Options A and C are not correct-licensing and module enablement are not the reason for the absence here; it is due to module capability in agentless mode.

Option D is incorrect-VMware Guest Introspection is not relevant to Application Control's availability.

NEW QUESTION # 31

Which of the following statements is false regarding the Log Inspection Protection Module?

- A. Scan for Recommendations identifies Log Inspection rules that Deep Security should implement.
- B. The Log Inspection Protection Module is supported in both agent-based and agentless environments.
- C. Custom Log Inspections rules can be created using the Open Source Security (OSSEC) standard.
- D. Deep Security Manager collects Log Inspection Events from Deep Security Agents at every heartbeat.

Answer: B

Explanation:

Log Inspection requires running some analysis on the computer and is not supported in Agentless deployments.

Explication: Study Guide - page (310)

NEW QUESTION # 32

Which of following statements best describes Machine Learning in Deep Security?

- A. Machine Learning is a malware detection technique in which the Deep Security Agent monitors process memory in real time and once a process is deemed to be suspicious, Deep Security will perform additional checks with the Smart Protection Network to determine if this is a known good process.
- B. Machine Learning is malware detection technique in which features of an executable file are compared against a cloud-based learning model to determine the probability of the file being malware.
- C. Machine Learning is malware detection technique in which processes on the protected computer are monitored for actions that are not typically performed by a given process.
- D. Machine Learning is a malware detection technique in which files are scanned based on the true file type as determined by the file content, not the extension.

Answer: B

Explanation:

Predictive Machine Learning

NEW QUESTION # 33

Which of the following statements regarding the Integrity Monitoring Protection Module is true?

- A. Any changes to monitored system objects that are detected after a Recommendation Scan is run on the protected computer are assumed to be malicious.
- B. The Integrity Monitoring Protection Module can detect changes to the system, but lacks the ability to distinguish between legitimate and malicious changes.
- C. Any changes to the system objects monitored by the Integrity Monitoring Protection Module are assumed to be legitimate, however, an administrator can revise the status of the object modification to Malicious during a review of the Integrity Monitoring Events.
- D. The Integrity Monitoring rules include a property that identifies whether a change to a monitored system object was performed as part of a legitimate operation.

Answer: B

Explanation:
integrity-monitoring-set-up

NEW QUESTION # 34

What is the default priority assigned to Firewall rules using the Allow action?

- A. Firewall rules using the Allow action always have a priority of 4.
- B. Firewall rules using the Allow action can be assigned a priority between 0 and 4.
- C. Firewall rules using the Allow action always have a priority of 0.
- D. Firewall rules using the Allow action can be assigned a priority between 1 and 3.

Answer: B

Explanation:
Firewall rules in Deep Security can be assigned a priority value between 0 (lowest) and 4 (highest), regardless of whether the action is Allow or Deny. The priority determines the order in which rules are evaluated.
