Salesforce Platform Developer I (PDI) Sample Questions (Q49-Q54):

NEW QUESTION # 49

Given the following code snippet, that is part of a custom controller for a Visualforce page:

```

public void updateContact(Contact thisContact){
    thisContact.Is_Active__c = false;
    try{
        update thisContact;
    }catch(Exception e){
        String errorMessage = 'An error occurred while updating the Contact: '+e.getMessage();
        ApexPages.addmessage(new ApexPages.Message(ApexPages.severity.FATAL,errorMessage));
    }
}

```

In which two ways can the try/catch be enclosed to enforce object and field-level permissions and prevent the DML statement from being executed if the current logged-in user does not have the appropriate level of access? Choose 2 answers

- A. Use `if (Schema.sObjectType.Contact.isAccessible ())`
- B. Use `if (thisContact.Owner == UserInfo.getUserId ())`
- C. Use `if (Schema, sObjectType, Contact, Field, Is_Active_c, is Updateable ())`
- D. Use `if (Schema, sObjectType, Contact, isUpdatable ())`

Answer: C,D

NEW QUESTION # 50

While working in a sandbox, an Apex test fails when run in the Test Runner. However, executing the Apex logic in the Execute Anonymous window succeeds with no exceptions or errors.

Why did the method fail in the sandbox test framework but succeed in the Developer Console?

- A. The test method relies on existing data in the sandbox.
- B. The test method is calling an `@future` method.
- C. The test method does not use `system.runAs` to execute as a specific user.
- D. The test method has a syntax error in the code.

Answer: A

NEW QUESTION # 51

A team of many developers work in their own individual orgs that have the same configuration at the production org. Which type of org is best suited for this scenario?

- A. Developer Sandbox
- B. Full Sandbox
- C. Developer Edition
- D. Partner Developer Edition

Answer: C

NEW QUESTION # 52

A developer has a requirement to create an Order When an Opportunity reaches a "Closed-Won" status. Which tool should be used to implement this requirement?

- A. Lightning Component
- B. Apex trigger
- C. Lightning
- D. Process Builder

Answer: B

NEW QUESTION # 53

What is the value of the `Trigger.old` context variable in a before insert trigger?

- A. An empty list of sObjects
- **B. null**
- C. Undefined
- D. A list of newly created sObjects without IDs

Answer: B

Explanation:

- * Trigger.old in a before insert trigger:
- * The Trigger.old context variable contains the old version of the records being processed in the trigger.
- * In a before insert trigger, the records being processed are new and have no prior state in the database, so Trigger.old is null.
- * This behavior is specific to insert triggers because there is no "old" record to reference before the record is created.
- * Why is it null?
- * The Trigger.old variable is only populated for triggers that handle updates or deletions (e.g., before update, after update, before delete, after delete). For insert operations, no previous state of the record exists.
- * Why not the other options?
- * A. An empty list of sObjects:
- * This is incorrect because Trigger.old is not initialized as an empty list for insert triggers-it is simply null.
- * B. Undefined:
- * Trigger.old is defined in the trigger context, but it is null for insert operations. Undefined is not a valid Apex state.
- * D. A list of newly created sObjects without IDs:
- * This describes Trigger.new in a before insert trigger, not Trigger.old. Trigger.new contains the new records being inserted.
