Which statement about this partial Asset Identity List page is correct? (Choose one answer)

- A. A firewall policy has a Virtual Patching security profile applied to it.
- B. A firewall policy has an Antivirus security profile applied to it.
- C. A firewall policy has an Application Control security profile applied to it.
- D. A firewall policy has an Intrusion Prevention security profile applied to it.

**Answer: A**

Explanation:

Based on the OT Security 7.6 Architect study guide regarding the Asset Identity Center and Asset Management:

**Vulnerability Visibility:** The Asset Identity List tab displays key metadata for IT and OT devices, including detected addresses, users, and a specific column for Vulnerabilities.

**Virtual Patching Feature:** In the OT Security 7.6 architecture, the "Vulnerabilities" column is populated through the OT Security Service license, which includes "OT vulnerability correlation definitions & virtual patching signatures".

**Correlation Mechanism:** FortiGate extracts metadata from OT traffic and uses these signatures to identify known vulnerabilities on the assets. For these vulnerabilities to be identified and correlated in the Asset Identity Center as shown in the exhibit (displaying a count of 8 vulnerabilities), the Virtual Patching feature must be active.

**Architectural Implementation:** Virtual patching is a critical component of the "Protection" layer in OT networks, allowing administrators to secure legacy or unpatchable PLCs and RTUs by blocking exploit attempts at the network level using IPS-based virtual patching signatures.

**Exhibit Analysis:** The presence of identified vulnerabilities (the number "8" in the red shield) in the Asset Identity List confirms that the FortiGate is actively performing vulnerability correlation, which is the operational result of having a Virtual Patching security profile applied to the relevant firewall policy.
