NEW QUESTION # 31

(Choose the correct option to complete the sentence.)

- A. A problem that is NOT immediately relevant but signifies a condition that might cause future problems
- B. A failed session launch resulting from a scheduled application probe
- C. An unavailable application resulting from a machine failure
- D. A failure associated with the loss of functionality or data

Answer: D

Explanation:
Citrix Director includes application probing and health monitoring that categorizes issues into:
* Warnings
* Faults
* Failures
According to Citrix's monitoring definitions:
An Application Fault refers to a failure that impacts functionality or causes loss of service or data.
Specifically, a fault indicates that the application:
* Has experienced a significant failure
* Cannot provide expected functionality
* Has recorded an event indicating a serious problem
* Needs administrative attention
This differs from:
* Warnings (A) - non-critical issues that might lead to problems
* Application unavailable (C) - a condition caused by machine/host failure
* Probe failures (D) - failures detected through scheduled application probes and classified differently Therefore, an Application Fault directly relates to loss of functionality or data, making B correct.
