

Newest PCEP-30-02 Practice Questions - PCEP-30-02 Exam Pdf & PCEP-30-02 Prep Torrent

What's more, part of that DumpsTorrent PCEP-30-02 dumps now are free: <https://drive.google.com/open?id=1rrBzuPZ1TDEGkkHlzXCDOeyMHZCCtkDn>

We abandon all obsolete questions in this latest PCEP-30-02 exam torrent and compile only what matters toward actual real exam. Without voluminous content to remember, our PCEP-30-02 quiz torrent contains what you need to know and what the exam will test. So the content of our PCEP-30-02 quiz torrent is imbued with useful exam questions easily appear in the real condition. We are still moderately developing our latest PCEP-30-02 Exam Torrent all the time to help you cope with difficulties. All exam candidates make overt progress after using our PCEP-30-02 quiz torrent. By devoting ourselves to providing high-quality practice materials to our customers all these years, we can guarantee all content are the essential part to practice and remember. Stop dithering and make up your mind at once, PCEP-30-02 test prep will not let you down.

Python Institute PCEP-30-02 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Data Collections: In this section, the focus is on list construction, indexing, slicing, methods, and comprehensions; it covers Tuples, Dictionaries, and Strings.
Topic 2	<ul style="list-style-type: none"> parameters, arguments, and scopes. It also covers Recursion, Exception hierarchy, Exception handling, etc.

Topic 3	<ul style="list-style-type: none"> • Functions and Exceptions: This part of the exam covers the definition of function and invocation
Topic 4	<ul style="list-style-type: none"> • Loops: while, for, range(), loops control, and nesting of loops.

PCEP-30-02 Exam Sample Questions Answers & Trustable PCEP-30-02 Test Collection Pass Success

The price for PCEP-30-02 exam torrent are reasonable, and no matter you are a student at school or an employee in the enterprise, you can afford the expense. In addition, PCEP-30-02 exam dumps are reviewed by skilled professionals, therefore the quality can be guaranteed. We offer you free demo to have a try before buying PCEP-30-02 Exam Torrent from us, so that you can know what the complete version is like. Free update for one year is available, and the update version will be sent to your email address automatically.

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q14-Q19):

NEW QUESTION # 14

Insert the code boxes in the correct positions in order to build a line of code which asks the user for an Integer value and assigns it to the counter variable.

(Note: some code boxes will not be used.)

Answer:

Explanation:

```
counter = int ( "Enter count:" )
```

NEW QUESTION # 15

What is the expected output of the following code?

```
menu = ("syrniki": 12.8, "shashlik": 49.9, "berscht": 23.2)  
  
for value in menu.items():  
    print(value)
```

- A. yh
- B. 0
- C. 12.849.923.2
- D. The code is erroneous and cannot be run.

Answer: C

NEW QUESTION # 16

Arrange the binary numeric operators in the order which reflects their priorities, where the top-most position has the highest priority and the bottom-most position has the lowest priority.

*	PYTHON INSTITUTE
/	
**	

Answer:

Explanation:

**	
*	
/	

Explanation:

**	
/, //, %	
*	

The correct order of the binary numeric operators in Python according to their priorities is:

- * Exponentiation (**)
- * Multiplication (*) and Division (/, //, %)

* Addition (+) and Subtraction (-)

This order follows the standard mathematical convention of operator precedence, which can be remembered by the acronym PEMDAS (Parentheses, Exponents, Multiplication/Division, Addition/Subtraction).

Operators with higher precedence are evaluated before those with lower precedence, but operators with the same precedence are evaluated from left to right. Parentheses can be used to change the order of evaluation by grouping expressions.

For example, in the expression $2 + 3 * 4 ** 2$, the exponentiation operator ($**$) has the highest priority, so it is evaluated first, resulting in $2 + 3 * 16$. Then, the multiplication operator ($*$) has the next highest priority, so it is evaluated next, resulting in $2 + 48$. Finally, the addition operator ($+$) has the lowest priority, so it is evaluated last, resulting in 50.

You can find more information about the operator precedence in Python in the following references:

- * 6. Expressions - Python 3.11.5 documentation
- * Precedence and Associativity of Operators in Python - Programiz
- * Python Operator Priority or Precedence Examples Tutorial

NEW QUESTION # 17

Arrange the code boxes in the correct positions to form a conditional instruction which guarantees that a certain statement is executed when the speed variable is less than 50.0.

speed : < if 50.0

Answer:

Explanation:

speed : < if 50.0

if speed < 50.0 :

Explanation:

if speed < 50.0 :

One possible way to arrange the code boxes in the correct positions to form a conditional instruction which guarantees that a certain statement is executed when the speed variable is less than 50.0 is:

```
if speed < 50.0:  
    print("The speed is low.")
```

This code uses the `if` keyword to create a conditional statement that checks the value of the variable `speed`. If the value is less than 50.0, then the code will print "The speed is low." to the screen. The `print` function is used to display the output. The code is indented to show the block of code that belongs to the `if` condition.

You can find more information about the `if` statement and the `print` function in Python in the following references:

- * Python If... Else
- * Python Print Function

NEW QUESTION # 18

What happens when the user runs the following code?

```
speed = 0  
while speed < 30:  
    speed -= 2  
    if speed > 10:  
        continue  
    print("*", end="")  
else:  
    print("**")
```

- A. The program enters an infinite loop.
- B. The program outputs five asterisks (*****) to the screen.
- C. The program outputs three asterisks (***) to the screen.
- D. The program outputs one asterisk (*) to the screen.

Answer: A

Explanation:

Explanation

The code snippet that you have sent is a while loop with an `if` statement and a `print` statement inside it. The code is as follows:

```
while True: if counter < 0: print("") else: print("**")
```

The code starts with entering a while loop that repeats indefinitely, because the condition "True" is always true. Inside the loop, the code checks if the value of "counter" is less than 0. If yes, it prints a single asterisk () to the screen. If no, it prints three asterisks (**) to the screen. However, the code does not change the value of "counter" inside the loop, so the same condition is checked over and over again. The loop never ends, and the code enters an infinite loop.

The program outputs either one asterisk () or three asterisks (**) to the screen repeatedly, depending on the initial value of "counter". Therefore, the correct answer is D. The program enters an infinite loop.

NEW QUESTION # 19

.....

The PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) practice questions have a close resemblance with the actual PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) exam. Our Python Institute PCEP-30-02 exam dumps give help to give you an idea about the actual PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) exam. You can attempt multiple PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) exam questions on the software to improve your performance.
