### NEW QUESTION # 85

In an IP datagram, which field identifies the receiving application?

- A. The port field of the transport layer header
- B. The protocol field of the network layer header

- C. The port field of the network layer address
- D. The protocol field of the transport layer header

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From Nokia 7750 SR OS Protocol Fundamentals:

"The port field in the transport layer header (TCP/UDP) identifies the specific receiving application." Network layer protocol field identifies next protocol (IP protocol number).

Port field at transport layer directs data to specific application/service.

Thus, correct answer is B.

#### NEW QUESTION # 86

Routing Information Base (RIB)

Thus, correct answer is C.

#### NEW QUESTION # 88

Click on the exhibit.

The route table on router R2 shows the system address of router R5 but it does not show any of the interfaces from the non-OSPF area.

What may be causing this?

- A. Router R5 does not have an export policy for these prefixes.
- B. Router R1 needs to have an import policy added to it.
- C. 'asbr' is missing from router R1's configuration.
- D. Router R1 needs to have an export policy added to it.

**Answer: A**

### Explanation:

### Detailed Analysis:

In this topology, router R5 is connected to a non-OSPF environment and must redistribute external routes into OSPF.

R5 is acting as an ASBR.

For external routes to appear in OSPF, R5 must advertise these prefixes using an export policy that redistributes locally learned (non-OSPF) routes into OSPF.

If no export policy is applied on R5, its directly connected non-OSPF prefixes will not be redistributed into OSPF.

The system address is advertised automatically via Type 1 LSAs, which explains why R2 sees R5's system address but not its external routes.

Thus, correct answer:

C). Router R5 does not have an export policy for these prefixes.
