GH-500 New Study Questions - GH-500 Free Braindumps

Perhaps you worry about that you have difficulty in understanding our GH-500 training questions. Frankly speaking, we have taken all your worries into account. Firstly, all knowledge of the GH-500 exam materials have been simplified a lot. Also, we have tested many volunteers who can prove that after studying our GH-500 Exam Questions for 20 to 30 hours, it is easy to pass the exam. The results show that our GH-500 study materials are easy for them to understand. In addition, they all enjoy learning on our GH-500 practice exam study materials.

Microsoft GitHub Advanced Security Sample Questions (Q54-Q59):

NEW QUESTION # 54

What is the minimum role needed in order to view the secret scanning alerts list within the Security tab of a repository?

- **A. repository owner**
- B. Write
- C. Admin
- D. Read

Answer: A

Explanation:

Viewing and filtering alerts from secret scanning

Who can use this feature?

Repository owners, organization owners, security managers, and users with the admin role Note: About the secret scanning alerts page When you enable secret scanning for a repository or push commits to a repository with secret scanning enabled, GitHub scans the contents for secrets that match patterns defined by service providers.

When secret scanning detects a secret, GitHub generates an alert. GitHub displays an alert in the Security tab of the repository

NEW QUESTION # 55

A repository's dependency graph includes:

- A. Dependencies from all your repositories.
- **B. Dependencies parsed from a repository's manifest and lock files.**
- C. A summary of the dependencies used in your organization's repositories.
- D. Annotated code scanning alerts from your repository's dependencies.

Answer: B

Explanation:

The dependency graph in a repository is built by parsing manifest and lock files (like package.json, pom.xml, requirements.txt). It helps GitHub detect dependencies and cross-reference them with known vulnerability databases for alerting.

It is specific to each repository and does not show org-wide or cross-repo summaries.

NEW QUESTION # 56

You are managing code scanning alerts for your repository. You receive an alert highlighting a problem with data flow. What do you click for additional context on the alert?

- **A. Show paths**
- B. Code scanning alerts
- C. Security

Answer: A

Explanation:

When dealing with a data flow issue in a code scanning alert, clicking on "Show paths" provides a detailed view of the data's journey through the code. This includes the source of the data, the path it takes, and where it ends up (the sink). This information is crucial for understanding how untrusted data might reach sensitive parts of your application and helps in identifying where to implement proper validation or sanitization.

NEW QUESTION # 57

Why should you dismiss a code scanning alert?

- A. to prevent developers from introducing new problems
- B. if there is a production error in your code
- C. if you fix the code that triggered the alert
- **D. if it includes an error in code that is used only for testing**

Answer: D

Explanation:

You should dismiss a code scanning alert if the flagged code is not a true security concern, such as:

*-> Code in test files

Code paths that are unreachable or safe by design

False positives from the scanner

Fixing the code would automatically resolve the alert - not dismiss it. Dismissing is for valid exceptions or noise reduction.

NEW QUESTION # 58

Which of the following is required to block the merge of a pull request containing critical vulnerabilities? Each correct answer presents part of the solution. (Choose two.)

- A. Add a repository ruleset.
- B. Enable Dependabot for the organization.
- C. Establish the protection rules in the code security settings.
- D. Configure a CODEOWNERS file in the repository.

Answer: A,C

Explanation:

Set code scanning merge protection

You can use rulesets to set code scanning merge protection for pull requests.

You can use rulesets to prevent pull requests from being merged when one of the following conditions is met:

A required tool found a code scanning alert of a severity that is defined in a ruleset.

A required code scanning tool's analysis is still in progress.

A required code scanning tool is not configured for the repository.

Note:

Creating a merge protection ruleset for a repository

1. On GitHub, navigate to the main page of the repository.
2. Under your repository name, click Settings. If you cannot see the "Settings" tab, select the dropdown menu, then click Settings.
3. In the left sidebar, under "Code and automation," click Rules, then click Rulesets.
4. Click New ruleset.
5. To create a ruleset targeting branches, click New branch ruleset.
6. Under "Ruleset name," type a name for the ruleset.
7. Optionally, to change the default enforcement status, click Disabled and select an enforcement status.
8. Under "Branch protections", select Require code scanning results.
9. Under "Required tools and alert thresholds", click Add tool and select a code scanning tool with the dropdown. For example, "CodeQL".
10. Next to the name of a code scanning tool:
Click Alerts and select one of: None, Errors, Errors and Warnings or All.
Click Security alerts and select one of: None, Critical, High or higher, Medium or higher, or All.

NEW QUESTION # 59

.....

If you are not sure whether our GH-500 exam braindumps are suitable for you, you can request to use our trial version. Of course, GH-500 learning materials produced several versions of the product to meet the requirements of different users. You can also ask to try more than one version and choose the one that suits you best. And we have three different versions Of our GH-500 Study Guide: the PDF, the Software and the APP online.
