Topic 4	• Recognize and interpret essential integration concepts and terminology: This domain focuses on foundational concepts including cloud service models, infrastructure types, networking protocols, data formats, security principles, and API classifications.
Topic 5	• Describe the components and benefits of Anypoint Platform for system integration: This domain covers Anypoint Platform's integration components, connectors, runtime • control planes, deployment options, and reusable Exchange assets.

Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q12-Q17):

NEW QUESTION # 12
A developer needs to discover which API specifications have been created within the organization before starting a new project.

- A. Runtime Manager
- B. Object Store2
- C. Anypoint Exchange
- D. API Manager

Answer: C

Explanation:
4
Anypoint Exchange: This is the central repository and knowledge base o5f the Anypoint Platform. It is designed specifically for Discovery and Reuse. 6 The Workflow: Before building a new integration, a developer searches Exchange to see if an Asset (API Specification, Fragment, Connector, or Template) already exists. This prevents duplication of effort-a core tenet of the API-led connectivity approach.
Why others are incorrect:
Runtime Manager: Used for deploying and monitoring running applications.
API Manager: Used for applying policies and governing APIs, not primarily for discovery by developers.
Object Store: A mechanism for storing data/state within a Mule application.

NEW QUESTION # 13
According to MuleSoft's recommended REST conventions, which HTTP method should an API use to specify how API clients can request data from a specified resource?

- A. POST
- B. GET

- C. PUT
- D. PATCH

Answer: B

Explanation:
HTTP GET: The GET method is used to retrieve (read) a representation of a resource4. It is safe and idempotent, meaning it does not alter the state of the server.
Usage: If you want to "request data" (e.g., Get Customer Details), GET is the standard method.
Why others are incorrect:
POST: Used to create a new resource.
PUT: Used to replace (update) an entire resource.
PATCH: Used to partially update a resource.

NEW QUESTION # 14
An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process. It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create, and fulfill new product orders.

- A. Streaming
- B. Orchestration
- C. Multicasting
- D. Aggregation

Answer: B

Explanation:
Orchestration: This refers to the logic where a central controller (the Process API) manages the interactions between multiple systems to achieve a business goal.
The Scenario: The API is "coordinating stateful interactions" (e.g., Step 1: Validate Customer -> Step 2: Check Inventory -> Step 3: Debit Payment -> Step 4: Create Shipment). This strictly sequential or logic-driven coordination is the definition of Orchestration.
Why others are incorrect:
Aggregation: Specifically refers to just gathering data from multiple sources (Scatter-Gather) and combining the results, usually without complex state management or sequential logic.
Streaming: Refers to processing data in continuous chunks, not the logic of coordinating services.

NEW QUESTION # 15
An IT integration delivery team begins a project by gathering all of the requirements, and proceeds to execute the remaining project activities as sequential, non-repeating phases. Which IT project delivery methodology is this team following?

- A. Scrum
- B. Kanban
- C. Waterfall
- D. Agile

Answer: C

Explanation:
Waterfall Methodology: This traditional approach is characterized by a linear, sequential design process2.
Key Characteristics:
Upfront Requirements: All requirements are gathered at the very beginning (as stated in the question).
Sequential Phases: Analysis -> Design -> Implementation -> Testing -> Deployment.
Non-repeating: You typically do not go back to a previous phase once it is signed off.
Why others are incorrect: Agile, Scrum, and Kanban are iterative methodologies that encourage repeating cycles (sprints) and evolving requirements, which is the opposite of the scenario described.

NEW QUESTION # 16
According to MuleSoft, which system integration term describes the method, format, and protocol used for communication between

two systems? 4

- A. Interface
- B. Message
- C. Component
- D. Interaction

Answer: A
