## Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q192-Q197):

### NEW QUESTION # 192

A data engineer is tasked with using Snowflake Cortex's COMPLETE function to generate concise summaries of customer reviews stored in a table named 'CUSTOMER REVIEWS'. The

'CUSTOMER REVIEWS' table contains a column named 'REVIEW TEXT' with the raw review text. They want to optimize for cost and performance. Which of the following SQL snippets represents the MOST efficient and cost-effective way to achieve this, assuming the summaries should ideally be no more than 50 words?

- A. Option D
- B. Option B
- C. Option C
- D. Option A
- E. Option E

**Answer: A**

Explanation:

The most cost-effective solution will leverage the smallest model that meets the requirements (snowflake-arctic-small). While all options function, using 'snowflake-arctic-small' minimizes compute costs. The instruction 'Summarize the following review in no more than 50 words:' is a reasonable prompt for summarization.

### NEW QUESTION # 193

Which of the following statements are true about Cortex functions?

- A. They can be combined to perform complex data processing tasks
- B. They can handle structured and semi-structured data
- C. They support multiple languages
- D. They are limited to a specific domain

**Answer: A,B,C**

Explanation:

Snowflake Cortex functions enable AI-powered operations directly within SQL and Python, supporting multiple languages via translation, classification, summarization, and document extraction functions. They operate seamlessly on structured and semi-structured data stored in VARIANT columns, allowing LLMs to process text, JSON, documents, and rich content.

Cortex functions can be combined within SQL pipelines—for example, using PARSE\_DOCUMENT to extract data, followed by CLASSIFY\_TEXT to categorize extracted fields, and then SUMMARIZE to produce narrative summaries. This composability enables sophisticated multi-stage workflows for document intelligence, support ticket analysis, compliance automation, and semantic enrichment.

They are not limited to a single domain; Cortex functions apply to finance, retail, support operations, healthcare, legal analysis, and general AI-assisted data processing.

Thus, Cortex functions are versatile, multi-domain, multi-language tools integrated with Snowflake's compute and governance layers.

### NEW QUESTION # 194

You are tasked with loading data from a set of CSV files located in an Amazon S3 bucket into a Snowflake table named 'CUSTOMER DATA'. The files have headers, but some files might have inconsistent column order compared to the table schema. The table 'CUSTOMER DATA' is already created with the correct schema. Which of the following COPY INTO command options is BEST suited to handle this situation efficiently, minimizing manual intervention and ensuring all relevant data is loaded?

- A. Create a view on top of the staged data using 'SELECT' statements that explicitly map columns by name to the

'CUSTOMER DATA' table. Then, 'INSERT data from the view into the table.

- B. Use a simple 'COPY INTO' statement without any specific options and rely on Snowflake's automatic column matching. If errors occur, manually adjust the files and reload.
- C. Define a file format object with 'SKIP\_HEADER = 1' and -- (if applicable). Use 'MATCH BY COLUMN NAME-CASE INSENSITIVE along with 'ON\_ERROR = SKIP FILE in the COPY INTO statement. Use 'VALIDATE function to check the staging file first before actual loading.
- D. Use 'ORDER BY clause in the 'COPY INTO' statement to explicitly define the order of columns from CSV files to target table columns.
- E. Use along with 'ON\_ERROR = CONTINUE in the COPY INTO statement. Define a file format object with = 1' and reference this object in the COPY INTO statement.

**Answer: E**

Explanation:

Ensures that columns are matched by name regardless of case, handling inconsistent column order. ERROR = CONTINUE' allows loading to proceed even if some rows have errors, and

'SKIP HEADER = in file format skips the headers. Using a view adds an unnecessary step and overhead. 'ORDER\_BY is not relevant for controlling the order of columns being loaded. While

'VALIDATE' is useful for pre-loading checks, can lead to data loss if a single row error exists in the whole file. 'ON ERROR=CONTINUE along with monitoring the error logs offers a more controlled loading process.

### NEW QUESTION # 195

Which two actions are possible within a single Snowflake Notebook session? (Choose two)

- A. Execute multiple SQL queries
- B. Load data into tables
- C. Manage user roles
- D. Create database backups

**Answer: A,B**

### NEW QUESTION # 196

What file extension is commonly used for Snowflake notebooks?

- A. .ipnb
- B. .txt
- C. .sql
- D. .ipynb

**Answer: D**

Explanation:

Snowflake notebooks use the .ipynb file extension, the standard format for Jupyter notebooks. This format stores executable code, markdown, metadata, and cell outputs in a structured JSON layout. Snowflake adopts this format to ensure compatibility with the broader Python ecosystem, thereby enabling seamless migration between Snowflake and external notebook environments.

The .ipynb structure allows mixed SQL and Python cells, visualizations, Streamlit components, documentation, and stepwise development within Snowsight. It supports reproducibility, collaboration, and integration with Snowpark and Cortex.

Incorrect formats:

\* .ipnb is a misspelling and invalid.

\* .sql is used for SQL scripts only.

\* .txt cannot represent notebook metadata or cell structure.

Thus, .ipynb is the correct and only supported notebook format.
