CertiProf Ethical Hacking Professional Certification Exam Sample Questions (Q31-Q36):

NEW QUESTION # 31

What is a security breach?

- A. The hacking of the entire internet.
- **B. A cybersecurity incident that results in unauthorized access to personal or corporate data.**
- C. An internet shutdown or breakup.

Answer: B

Explanation:

A security breach is a cybersecurity incident in which unauthorized individuals gain access to sensitive personal or organizational data, making option A the correct answer. Security breaches can involve data theft, data exposure, system compromise, or loss of confidentiality, integrity, or availability.

Breaches may occur due to malware infections, phishing attacks, weak credentials, unpatched vulnerabilities, insider threats, or misconfigured systems. Ethical hackers analyze breach scenarios to understand how attackers bypass defenses and what impact the breach can have on business operations.

Option B is incorrect because hacking the entire internet is unrealistic and not a valid definition. Option C is incorrect because internet outages are infrastructure issues, not necessarily security breaches.

From a defensive standpoint, understanding security breaches helps organizations improve detection, response, and recovery capabilities. Ethical hackers help simulate breach scenarios to identify gaps in monitoring and incident response plans.

Preventing breaches requires layered security controls, user awareness, continuous monitoring, and regular testing. Ethical hacking plays a critical role in reducing breach likelihood and impact.

NEW QUESTION # 32

What is the results report document?

- A. A document that lists tasks left unfinished due to time constraints.
- **B. A document that details findings, including identified vulnerabilities and exposed sensitive information.**
- C. A document used only to sign the agreement with the client.

Answer: B

Explanation:

The results report document is a critical deliverable in the penetration testing process, making option B the correct answer. This document summarizes the findings of the engagement, including discovered vulnerabilities, exposed sensitive information, attack paths, and the potential impact on the organization.

A professional penetration testing report typically includes an executive summary, methodology, scope, risk ratings, technical details, evidence, and remediation recommendations. The goal is not just to list vulnerabilities but to help stakeholders understand risk severity and business impact.

Option A is incorrect because incomplete work is usually addressed separately in project management documentation. Option C is incorrect because agreements and authorization documents are handled before testing begins, not in the results report.

From an ethical hacking standpoint, the results report supports transparency, accountability, and improvement. Ethical hackers must ensure findings are accurate, reproducible, and clearly explained. Poor reporting can reduce the value of an otherwise successful test.

The report also serves as a roadmap for remediation, allowing organizations to prioritize fixes, improve controls, and reduce future attack surfaces. High-quality reporting is a defining characteristic of professional ethical hacking.

NEW QUESTION # 33

What is ZAP?

- **A. It is an open-source penetration testing tool used to evaluate the security of web applications.**
- B. It is a term used to describe the collection and analysis of information from publicly available sources, such as websites, social networks, government databases, news articles, among other resources freely available on the web.
- C. ZAP is a closed source penetration testing tool used to evaluate online servers.

Answer: A

Explanation:

The OWASP Zed Attack Proxy (ZAP) is one of the world's most popular free, open-source security tools for finding vulnerabilities in web applications. It is actively maintained by a global community of volunteers under the Open Web Application Security Project (OWASP). ZAP acts as a "man-in-the-middle proxy," meaning it sits between the tester's web browser and the web application being tested. This allows the tester to intercept, inspect, and even modify the requests and responses traveling between the two. ZAP provides a wide array of functionalities essential for the Web Application Pentesting process:

* Automated Scanner: It can automatically crawl a website to find vulnerabilities like SQL injection, Cross-Site Scripting (XSS), and insecure headers.

* Spidering: It maps out the structure of a website by following every link it finds.

* Fuzzing: It can send many variations of malicious input to a specific field to see if it can break the application or trigger an error.

* Active and Passive Scanning: It can passively watch traffic to find easy-to-spot issues or actively probe the server for deeper flaws.

For ethical hackers, ZAP is often compared to the commercial tool Burp Suite. While both perform similar tasks, ZAP's open-source nature and robust API make it a favorite for integrating into "DevSecOps" pipelines, where it can automatically test new code for vulnerabilities before it is deployed. Mastering ZAP is a core skill for any professional focused on securing the web-facing assets of an organization.

NEW QUESTION # 34

Which of the following is a network security protocol designed to authenticate and authorize remote users to securely access network resources?

- A. SSL (Secure Sockets Layer).
- **B. SSH (Secure Shell).**
- C. FTP (File Transfer Protocol).

Answer: B

Explanation:

Secure Shell (SSH) is a robust cryptographic network protocol utilized for operating network services securely over an unsecured network. Its primary application is the secure remote login to computer systems by administrators and users. Unlike earlier protocols such as Telnet or rlogin, which transmitted data (including passwords) in plain text, SSH provides a secure, encrypted channel. It achieves this through a suite of cryptographic techniques that ensure the confidentiality, integrity, and authenticity of the data being transmitted between the client and the server.

The protocol operates using a client-server architecture, where an SSH client initiates a connection to an SSH server. SSH facilitates both authentication and authorization. Authentication is typically performed using either a password or, more securely, a public-private key pair. Once the user's identity is verified, the protocol authorizes the level of access based on the server's configuration. Beyond simple terminal access, SSH supports secure file transfers (SFTP) and port forwarding, allowing other network protocols to be "tunneled" through its encrypted connection. From a security standpoint, while SSH is highly secure, it can be breached if misconfigured—such as by allowing weak passwords or failing to disable root login. Consequently, ethical hackers prioritize hardening SSH services as a fundamental control in protecting organizational assets.

NEW QUESTION # 35

What is Whois?

- A. It is a physical directory where names and ip addresses can be consulted since the beginning of the Internet.
- **B. It is a public directory through which you can know "who is" the owner of a domain or IP address.**
- C. It is a directory by which it is possible to know where exactly the owner of a domain or IP address lives.

Answer: B

Explanation:

WHOIS is a query and response protocol widely used for searching databases that store the registered users or assignees of an Internet resource, such as a domain name or an IP address block. It acts as a public directory that provides essential information about the ownership and technical management of a specific online asset.

When an individual or organization registers a domain name, they are required by ICANN (Internet Corporation for Assigned Names and Numbers) to provide contact information, which is then made available through WHOIS lookups.

A standard WHOIS record typically contains:

- * Registrant Information: The name and organization of the person who owns the domain.
- * Administrative and Technical Contacts: Names and email addresses of the people responsible for the site's operation.
- * Registrar Information: The company where the domain was purchased and the date of registration /expiration.
- * Name Servers: The servers that direct traffic for the domain.

In ethical hacking, WHOIS is a primary tool for passive reconnaissance. It allows a tester to map out the organizational structure of a target without ever sending a packet to the target's network. For example, finding the technical contact's email address might provide a lead for a social engineering attack, or identifying the name servers might reveal the cloud provider being used. While many owners now use "WHOIS Privacy" services to hide their personal details behind a proxy, WHOIS remains a critical first step in defining the "footprint" of a target and understanding its administrative boundaries.
