Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q28-Q33):

NEW QUESTION # 28

Which of the following BEST describes capacity planning?

- A. Monitoring the percentage of capacity of resources being used over a time period
- B. Activates used to create a plan that manages resources to meet service demand
- C. Activities performed to manage provider resources and provide multiple services
- **D. Determining the maximum amount that any resource can accommodate or deliver**

Answer: D

NEW QUESTION # 29

Which of the following is the BEST description of a Customer Reliability Engineer (CRE)?

- **A. They integrate with the customer's operations team to share responsibilities**
- B. They work with the cloud provider's SRE team to ship and build new features
- C. They take a software engineering approach to redesign all cloud services
- D. They use deep engineering expertise to improve the cloud provider's services

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Customer Reliability Engineering (CRE) is described in Google's SRE literature as an extension of SRE practices outward to customers who run workloads on cloud platforms. The SRE Book and the SRE Workbook state: "CRE is the practice of sharing SRE principles with customers, working closely with their operations teams, and establishing shared responsibility for reliability." (SRE Workbook - Chapter: Customer Reliability Engineering). A CRE team collaborates directly with customer engineering and operations teams to identify reliability risks, review architectures, and co-manage SLOs, but does not redesign cloud services or build new features.

Option D matches the exact intention: CRE integrates with the customer's operations team to share reliability responsibilities, applying SRE methods to customer systems and ensuring both customer and provider work jointly on reliability goals.

Option A is incorrect-CRE does not redesign cloud services.

Option B misinterprets CRE as improving the provider's internal systems.

Option C incorrectly focuses on feature shipping; CRE is about reliability guidance, not feature delivery.

Thus, D is the correct and SRE-authentic answer.

NEW QUESTION # 30

Which of the following BEST describes a business continuity plan?

- A. The way that data, files, applications, and systems are restored
- **B. The way the organization maintains operations during a disaster**
- C. The management of risks that seriously affect the organization
- D. The activity of returning a configuration item back to normal

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

A Business Continuity Plan (BCP) is a critical component of organizational resilience. While not unique to SRE, SRE strongly intersects with continuity planning because reliable systems must continue functioning during disruptions. According to Google's SRE

principles, reliability extends beyond typical outages and includes "ensuring services continue to operate even under exceptional conditions." (SRE Book - Chapter:

Addressing Risks). A business continuity plan specifically outlines how essential operations are maintained during major disruptions such as natural disasters, data center outages, or large-scale system failures.

Option A-"The way the organization maintains operations during a disaster"-matches the formal definition of BCP.

Option B refers to disaster recovery (DR), which is separate; DR focuses on restoring systems, not maintaining ongoing operations.

Option C refers to configuration management activities, not continuity.

Option D refers to risk management, which informs BCP but does not define it.

Therefore, A is the correct answer because it directly reflects the purpose of continuity planning as supported by reliability-focused guidance.
