WGU MANAGING CLOUD SECURITY QUESTIONS WITH ANSWERS UPDATED 2025 - 2026

Infrastructure as a Service (IaaS) ANS -

Allows the customer to install all software, including operating systems (OSs) on hardware housed and connected by the cloud vendor.

Platform as a Service (PaaS) ANS -

Contains everything included in IaaS, with the addition of OSs. This model is especially useful for software development operations (DevOps).

Software as a Service (SaaS) ANS -

Includes everything listed in the previous Infrastructure as a Service (IaaS) and Platform as a Service (PaaS) models, with the addition of software programs.

Encryption ANS -

Offers a degree of assurance that nobody without authorization will be able to access your data in a meaningful way.

Cloud Service Provider (CSP) ANS -

Provides administrative assistance for the customer and the customer's data and processing needs. Examples include Amazon Web Services, Rackspace, and Microsoft's Azure.

Virtualization ANS -

A process of creating a virtual version of something, including virtual computer hardware platforms, operating systems, storage devices, and computer network resources.

Vendor lock-in ANS -

Occurs in a situation where a customer may be unable to leave, migrate, or transfer to an alternate provider due to technical or non-technical constraints.

Cloud provider ANS -

A service provider that offers customer storage or software solutions available via a public network, usually the Internet.

We stress the primacy of customers' interests on our Managing-Cloud-Security training quiz, and make all the preoccupation based on your needs. We assume all the responsibilities our Managing-Cloud-Security practice materials may bring. They are a bunch of courteous staff waiting for offering help 24/7. You can definitely contact them when getting any questions related with our Managing-Cloud-Security Study Materials. And our staffs will help you in the first time with the most professional knowledge.

Nowadays everyone is interested in the field of WGU because it is growing rapidly day by day. The Managing-Cloud-Security credential is designed to validate the expertise of candidates. But most of the students are confused about the right preparation material for WGU Managing-Cloud-Security Exam Dumps and they couldn't find real WGU Managing Cloud Security (JY02) (Managing-Cloud-Security) exam questions so that they can pass Managing-Cloud-Security certification exam in a short time with good grades.

WGU Managing Cloud Security (JY02) Sample Questions (Q80-Q85):

NEW QUESTION # 80

Which phase of the cloud data life cycle occurs almost in parallel with the create phase?

- A. Store
- **B. Use**
- C. Archive
- D. Share

Answer: B

Explanation:

The Use phase of the cloud data life cycle occurs almost in parallel with the Create phase because data is often accessed and processed immediately after it is generated. Managing Cloud principles describe that in modern cloud environments, data creation and data usage are closely linked, especially in real-time systems, applications, and analytics workloads.

As soon as data is created-such as user input, application logs, or transaction records-it is frequently consumed by applications, services, or users without delay. This immediate consumption places the Use phase alongside the Create phase rather than strictly after it. Security controls during this period must address both phases simultaneously, including access control, authentication, encryption, and monitoring.

Other phases do not align as closely. The Store phase focuses on data at rest after creation, the Share phase involves distributing data to other parties, and the Archive phase occurs much later for long-term retention.

Because data is commonly viewed, processed, or analyzed immediately after creation, the Use phase is considered to occur almost in parallel with the Create phase.

NEW QUESTION # 81

Which technology is increasingly deployed in enterprise environments for applications such as digital tracking of the supply chain?

- **A. Internet of Things**
- B. Cloud computing
- C. Big data
- D. Machine learning

Answer: A

Explanation:

The Internet of Things (IoT) is increasingly deployed in enterprise environments for digital tracking of supply chains. Managing Cloud principles explain that IoT enables physical objects-such as sensors, tags, and devices-to collect and transmit data in real time.

In supply chain scenarios, IoT devices track location, temperature, humidity, and movement of goods throughout manufacturing, transportation, and storage. This continuous data collection improves visibility, efficiency, and accountability across the supply chain. Cloud platforms commonly support IoT by aggregating, storing, and analyzing the collected data.

Cloud computing provides infrastructure, big data analyzes large datasets, and machine learning derives insights, but IoT is the enabling technology that performs real-time tracking. Therefore, Internet of Things is the correct answer.

NEW QUESTION # 82

What is the first phase of identity management that is used to assert the identity of the user?

- **A. Provisioning**
- B. Decentralization
- C. Deprovisioning
- D. Centralization

Answer: A

Explanation:

Provisioning is the first phase of identity management used to assert a user's identity. Managing Cloud documentation explains that identity management begins with establishing and registering a user within an identity system. Provisioning involves creating a digital identity, assigning unique identifiers, and associating credentials that allow the user to be recognized by systems and applications. This phase forms the foundation for all subsequent identity and access management processes. Without proper provisioning, authentication and authorization cannot occur because the system has no trusted identity to evaluate. Provisioning also includes defining initial roles and access levels based on organizational policies.

Centralization and decentralization describe architectural approaches to managing identities rather than lifecycle phases.

Deprovisioning occurs at the end of the lifecycle when access is revoked. Therefore, provisioning is correctly identified as the first phase where the user's identity is established and asserted.

NEW QUESTION # 83

Which item must be examined in detail when evaluating the risks associated with a new software as a service (SaaS) solution?

- **A. Historical availability of services**
- B. Maintenance releases or patches to install
- C. Use of low-level accounts for administrative tasks
- D. Leverage of multi-factor authentication for all cloud access

Answer: A

Explanation:

When evaluating the risks of a new Software as a Service (SaaS) solution, the historical availability of services must be examined in detail. Managing Cloud principles explain that availability is a critical risk factor because customers rely entirely on the provider to deliver uninterrupted access to applications and data.

Reviewing historical uptime, outage frequency, and incident response performance provides insight into the provider's operational maturity and resilience. Past availability metrics help organizations assess whether the SaaS provider can meet business continuity, disaster recovery, and service level expectations.

The other options represent security controls or operational activities but are not primary risk indicators during SaaS evaluation.

Administrative account usage and multi-factor authentication relate to access controls, while patching is managed by the provider in SaaS environments. Therefore, historical availability is the most relevant item to assess.

NEW QUESTION # 84

Which cloud architecture model provides application development services?

- **A. Platform as a Service (PaaS)**
- B. Software as a Service (SaaS)
- C. Security as a Service (SECaaS)
- D. Infrastructure as a Service (IaaS)

Answer: A

Explanation:

Platform as a Service (PaaS) provides application development services in cloud environments. Managing Cloud documentation explains that PaaS delivers development frameworks, programming languages, libraries, databases, and testing tools required to build and deploy applications.

This model eliminates the need to manage infrastructure and operating systems, allowing developers to rapidly create, test, and deploy applications. PaaS also supports scalability and integration with other cloud services.

SaaS delivers completed applications, IaaS provides raw infrastructure, and SECaaS focuses on security services. Therefore, PaaS is the correct model for application development services.
