## Pass Guaranteed Ping Identity - PAP-001 Authoritative Exam Quick Prep

Itcerttest Ping Identity PAP-001 Exam Questions are made in accordance with the latest syllabus and the actual Ping Identity PAP-001 certification exam. We constantly upgrade our training materials, all the products you get with one year of free updates. You can always extend the to update subscription time, so that you will get more time to fully prepare for the exam. If you still confused to use the training materials of Itcerttest, then you can download part of the examination questions and answers in Itcerttest website. It is free to try, and if it is suitable for you, then go to buy it, to ensure that you will never regret.

### Ping Identity Certified Professional - PingAccess Sample Questions (Q48-Q53):

#### NEW QUESTION # 48

An administrator needs to reduce the number of archive backups that are maintained in the data/archive folder. Which file does the administrator need to modify to make this change?

- A. log4j2.xml
- B. jvm-memory.options
- C. run.properties
- D. log4j2.db.properties

**Answer: C**

Explanation:

PingAccess retains backup archives of its configuration in the data/archivedirectory. The number of retained backups is controlled in the run.properties file.

Exact Extract:

"The number of configuration backups retained in the data/archivedirectory is controlled by the archive.maxCount property in run.properties."

\* Option A (log4j2.db.properties) is incorrect; this file controls database logging, not archive retention.

\* Option B (jvm-memory.options) is incorrect; this file sets JVM heap and memory arguments.

\* Option C (run.properties) is correct - it contains system-level settings including archive.maxCount.

\* Option D (log4j2.xml) is incorrect; this file configures log appenders and levels, not archive backups.

Reference: PingAccess Administration Guide - Configuration Backup Management

#### NEW QUESTION # 49

Any company has several applications that need to load images and fonts from www.anycompany.com. Users are currently getting CORS errors. How should the Cross-Origin Request rule be set to allow secure access?

- A. Allowed Origins to www.anycompany.com and enable the Allow Credentials option
- B. Allowed Origins value for each of the listed domains
- C. Allowed Origins to \*.anycompany.com and disable the Allow Credentials option
- D. Allowed Origins to \* and enable the Allow Credentials option

**Answer: A**

Explanation:

To prevent CORS errors, administrators must configure a Cross-Origin Request (CORS) Processing Rule.

The secure practice is to allow the specific trusted domain (www.anycompany.com) and, when cookies or credentials are required, to enable Allow Credentials.

Exact Extract:

"For secure CORS, specify exact origins rather than wildcards. Enable 'Allow Credentials' when client-side resources must include cookies or authentication data."

\* Option A is incomplete - multiple values are possible, but in this case only www.anycompany.com is required.

\* Option B is less secure - using a wildcard (\*.anycompany.com) broadens exposure unnecessarily.

- \* Option C is insecure - \*with credentials is disallowed by CORS specifications.
  - \* Option D is correct - restricts access to the trusted domain and allows credentialed requests.
- Reference: PingAccess Administration Guide - Cross-Origin Request Rule

### NEW QUESTION # 50

An administrator needs to configure an application that uses a backend web server that has its own authentication mechanism. Which type of object must be configured for PingAccess to provide access to the target server?

- A. Web Session
- B. Token Provider
- **C. Site Authenticator**
- D. Access Control Rule

**Answer: C**

Explanation:

When a backend application requires its own authentication (e.g., Basic Auth or mutual TLS), PingAccess uses a Site Authenticator to inject the necessary credentials.

Exact Extract:

"Site Authenticators provide the credentials PingAccess uses when authenticating to target applications that require their own authentication mechanisms."

- \* Option A (Token Provider) is incorrect - this is used for OIDC/OAuth tokens, not site-level authentication.
- \* Option B (Web Session) manages end-user sessions, not backend site authentication.
- \* Option C (Site Authenticator) is correct - it handles authentication between PingAccess and the backend.
- \* Option D (Access Control Rule) enforces authorization, not backend authentication.

Reference: PingAccess Administration Guide - Site Authenticators

### NEW QUESTION # 51

Under which top-level directory are PingAccess configuration archives stored?

- **A. data**
- B. tools
- C. bin
- D. conf

**Answer: A**

Explanation:

PingAccess automatically creates configuration archive backups whenever changes are made. These are stored in the data/archivedirectory.

Exact Extract:

"PingAccess stores configuration archive files in the PA\_HOME/data/archivedirectory."

- \* Option A (tools) is incorrect - contains administrative scripts.
- \* Option B (conf) is incorrect - holds configuration files like run.properties.
- \* Option C (data) is correct - archives are stored under data/archive.
- \* Option D (bin) is incorrect - contains executables and scripts.

Reference: PingAccess Administration Guide - Configuration Archives

### NEW QUESTION # 52

An administrator is setting up PingAccess to terminate SSL for a proxied application. What action must the administrator take to configure an existing certificate for that application?

- **A. Assign the Key Pair to the Virtual Host**
- B. Enable Require HTTPS in the Application configuration
- C. Assign the Key Pair to the Agent Listener
- D. Set the secure flag to Yes in the Site configuration

**Answer: A**

Explanation:

PingAccess terminates SSL at the Virtual Host level. To configure an existing certificate, the administrator must assign the appropriate Key Pair (which contains the certificate and private key) to the Virtual Host.

Exact Extract:

"SSL termination occurs on the engine listener through virtual hosts. Assign the certificate's key pair to the virtual host to secure proxied applications."

- \* Option A is correct - assign the key pair to the Virtual Host for SSL termination.
- \* Option B is incorrect - Require HTTPS enforces secure access but does not configure SSL termination.
- \* Option C is incorrect - Agent Listener is for PingAccess Agents, not proxied apps.
- \* Option D is incorrect - secure flag affects cookie settings, not SSL certificates.
