C_TFG51_2211 Exam Format - 100% Valid Questions Pool

Our ACD-301 exam questions not only includes the examination process, but more importantly, the specific content of the exam. In previous years' examinations, the hit rate of ACD-301 learning quiz was far ahead in the industry. We know that if you really want to pass the exam, our study materials will definitely help you by improving your hit rate as a development priority. After using ACD-301 training prep, you will be more calm and it is inevitable that you will get a good result.

The value of professional qualification has been shown to rise with time. For the advancement of your profession, exams like the Appian exam given by Appian are crucial. Candidates aim to pass the Appian Certified Lead Developer exam on their first attempt. With Appian ACD-301 Exam Questions, applicants may study for and pass their desired certification exam on the first attempt. You may use ITExamDownload's top ACD-301 study resources to prepare for the Appian Certified Lead Developer exam. The Appian ACD-301 exam questions offered by ITExamDownload are dependable and trustworthy sources of preparation.

ACD-301 Free Brain Dumps, Valid ACD-301 Braindumps

Do you know why you feel pressured to work? That is because your own ability and experience are temporarily unable to adapt to current job requirements. To bur our ACD-301 practice engine at this time is to upgrade your skills and experience to the current requirements in order to have the opportunity to make the next breakthrough. And our ACD-301 Exam Braindumps are good to help you in developing your knowledge and skills. Besides, our ACD-301 study guide will reward you with the certification.

Appian Certified Lead Developer Sample Questions (Q40-Q45):

NEW QUESTION # 40

You are on a call with a new client, and their program lead is concerned about how their legacy systems will integrate with Appian. The lead wants to know what authentication methods are supported by Appian. Which three authentication methods are supported?

- A. CAC
- B. API Keys
- C. SAML
- D. Active Directory
- E. Biometrics
- F. OAuth

Answer: C,D,F

Explanation:

Comprehensive and Detailed In-Depth Explanation:

As an Appian Lead Developer, addressing a client's concerns about integrating legacy systems with Appian requires accurately identifying supported authentication methods for system-to-system communication or user access. The question focuses on Appian's integration capabilities, likely for both user authentication (e.g., SSO) and API authentication, as legacy system integration often involves both. Appian's documentation outlines supported methods in its Connected Systems and security configurations. Let's evaluate each option:

A . API Keys:

API Key authentication involves a static key sent in requests (e.g., via headers). Appian supports this for outbound integrations in Connected Systems (e.g., HTTP Authentication with an API key), allowing legacy systems to authenticate Appian calls. However, it's not a user authentication method for Appian's platform login-it's for system-to-system integration. While supported, it's less common for legacy system SSO or enterprise use cases compared to other options, making it a lower-priority choice here.

B . Biometrics:

Biometrics (e.g., fingerprint, facial recognition) isn't natively supported by Appian for platform authentication or integration. Appian relies on standard enterprise methods (e.g., username/password, SSO), and biometric authentication would require external identity providers or custom clients, not Appian itself. Documentation confirms no direct biometric support, ruling this out as an Appian-supported method.

C . SAML:

Security Assertion Markup Language (SAML) is fully supported by Appian for user authentication via Single Sign-On (SSO). Appian integrates with SAML 2.0 identity providers (e.g., Okta, PingFederate), allowing users to log in using credentials from legacy systems that support SAML-based SSO. This is a key enterprise method, widely used for integrating with existing identity management systems, and explicitly listed in Appian's security configuration options-making it a top choice.

D . CAC:

Common Access Card (CAC) authentication, often used in government contexts with smart cards, isn't natively supported by Appian as a standalone method. While Appian can integrate with CAC via SAML or PKI (Public Key Infrastructure) through an identity provider, it's not a direct Appian authentication option. Documentation mentions smart card support indirectly via SSO configurations, but CAC itself isn't explicitly listed, making it less definitive than other methods.

E . OAuth:

OAuth (specifically OAuth 2.0) is supported by Appian for both outbound integrations (e.g., Authorization Code Grant, Client Credentials) and inbound API authentication (e.g., securing Appian Web APIs). For legacy system integration, Appian can use OAuth to authenticate with APIs (e.g., Google, Salesforce) or allow legacy systems to call Appian services securely. Appian's Connected System framework includes OAuth configuration, making it a versatile, standards-based method highly relevant to the client's needs.

F . Active Directory:

Active Directory (AD) integration via LDAP (Lightweight Directory Access Protocol) is supported for user authentication in Appian. It allows synchronization of users and groups from AD, enabling SSO or direct login with AD credentials. For legacy systems using AD as an identity store, this is a seamless integration method. Appian's documentation confirms LDAP/AD as a core authentication option, widely adopted in enterprise environments-making it a strong fit.

Conclusion: The three supported authentication methods are C (SAML), E (OAuth), and F (Active Directory). These align with Appian's enterprise-grade capabilities for legacy system integration: SAML for SSO, OAuth for API security, and AD for user management. API Keys (A) are supported but less prominent for user authentication, CAC (D) is indirect, and Biometrics (B) isn't supported natively. This selection reassures the client of Appian's flexibility with common legacy authentication standards.

Appian Documentation: "Authentication for Connected Systems" (OAuth, API Keys).

Appian Documentation: "Configuring Authentication" (SAML, LDAP/Active Directory).

Appian Lead Developer Certification: Integration Module (Authentication Methods).

NEW QUESTION # 41

You are just starting with a new team that has been working together on an application for months. They ask you to review some of their views that have been degrading in performance. The views are highly complex with hundreds of lines of SQL. What is the first step in troubleshooting the degradation?

- A. Browse through the tables, note any tables that contain a large volume of null values, and work with your team to plan for table restructure.
- B. Go through all of the tables one by one to identify which of the grouped by, ordered by, or joined keys are currently indexed.
- C. Run an explain statement on the views, identify critical areas of improvement that can be remediated without business knowledge.
- D. Go through the entire database structure to obtain an overview, ensure you understand the business needs, and then normalize the tables to optimize performance.

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Troubleshooting performance degradation in complex SQL views within an Appian application requires a systematic approach. The views, described as having hundreds of lines of SQL, suggest potential issues with query execution, indexing, or join efficiency. As a new team member, the first step should focus on quickly identifying the root cause without overhauling the system prematurely.

Appian's Performance Troubleshooting Guide and database optimization best practices provide the framework for this process.

Option B (Run an explain statement on the views, identify critical areas of improvement that can be remediated without business knowledge):

This is the recommended first step. Running an EXPLAIN statement (or equivalent, such as EXPLAIN PLAN in some databases) analyzes the query execution plan, revealing details like full table scans, missing indices, or inefficient joins. This technical analysis can identify immediate optimization opportunities (e.g., adding indices or rewriting subqueries) without requiring business input, allowing you to address low-hanging fruit quickly. Appian encourages using database tools to diagnose performance issues before involving stakeholders, making this a practical starting point as you familiarize yourself with the application.

Option A (Go through the entire database structure to obtain an overview, ensure you understand the business needs, and then normalize the tables to optimize performance):

This is too broad and time-consuming as a first step. Understanding business needs and normalizing tables are valuable but require collaboration with the team and stakeholders, delaying action. It's better suited for a later phase after initial technical analysis.

Option C (Go through all of the tables one by one to identify which of the grouped by, ordered by, or joined keys are currently indexed):

Manually checking indices is useful but inefficient without first knowing which queries are problematic. The EXPLAIN statement provides targeted insights into index usage, making it a more direct initial step than a manual table-by-table review.

Option D (Browse through the tables, note any tables that contain a large volume of null values, and work with your team to plan for table restructure):

Identifying null values and planning restructures is a long-term optimization strategy, not a first step. It requires team input and may not address the immediate performance degradation, which is better tackled with query-level diagnostics.

Starting with an EXPLAIN statement allows you to gather data-driven insights, align with Appian's performance troubleshooting methodology, and proceed with informed optimizations.

NEW QUESTION # 42

You are designing a process that is anticipated to be executed multiple times a day. This process retrieves data from an external system and then calls various utility processes as needed. The main process will not use the results of the utility processes, and there are no user forms anywhere.

Which design choice should be used to start the utility processes and minimize the load on the execution engines?

- A. Start the utility processes via a subprocess asynchronously.
- B. Start the utility processes via a subprocess synchronously.
- C. Use the Start Process Smart Service to start the utility processes.
- D. Use Process Messaging to start the utility process.

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation:

As an Appian Lead Developer, designing a process that executes frequently (multiple times a day) and calls utility processes without using their results requires optimizing performance and minimizing load on Appian's execution engines. The absence of user forms indicates a backend process, so user experience isn't a concern—only engine efficiency matters. Let's evaluate each option:

A . Use the Start Process Smart Service to start the utility processes:

The Start Process Smart Service launches a new process instance independently, creating a separate process in the Work Queue. While functional, it increases engine load because each utility process runs as a distinct instance, consuming engine resources and potentially clogging the Java Work Queue, especially with frequent executions. Appian's performance guidelines discourage unnecessary separate process instances for utility tasks, favoring integrated subprocesses, making this less optimal.

B . Start the utility processes via a subprocess synchronously:

Synchronous subprocesses (e.g., `a!startProcess` with `isAsync: false`) execute within the main process flow, blocking until completion. For utility processes not used by the main process, this creates unnecessary delays, increasing execution time and engine load. With frequent daily executions, synchronous subprocesses could strain engines, especially if utility processes are slow or numerous.

Appian's documentation recommends asynchronous execution for non-dependent, non-blocking tasks, ruling this out.

C . Use Process Messaging to start the utility process:

Process Messaging (e.g., `sendMessage()` in Appian) is used for inter-process communication, not for starting processes. It's designed to pass data between running processes, not initiate new ones. Attempting to use it for starting utility processes would require additional setup (e.g., a listening process) and isn't a standard or efficient method. Appian's messaging features are for coordination, not process initiation, making this inappropriate.

D . Start the utility processes via a subprocess asynchronously:

This is the best choice. Asynchronous subprocesses (e.g., `a!startProcess` with `isAsync: true`) execute independently of the main process, offloading work to the engine without blocking or delaying the parent process. Since the main process doesn't use the utility process results and there are no user forms, asynchronous execution minimizes engine load by distributing tasks across time, reducing Work Queue pressure during frequent executions. Appian's performance best practices recommend asynchronous subprocesses for non-dependent, utility tasks to optimize engine utilization, making this ideal for minimizing load.

Conclusion: Starting the utility processes via a subprocess asynchronously (D) minimizes engine load by allowing independent execution without blocking the main process, aligning with Appian's performance optimization strategies for frequent, backend processes.

Appian Documentation: "Process Model Performance" (Synchronous vs. Asynchronous Subprocesses).

Appian Lead Developer Certification: Process Design Module (Optimizing Engine Load).

Appian Best Practices: "Designing Efficient Utility Processes" (Asynchronous Execution).

NEW QUESTION # 43

What are two advantages of having High Availability (HA) for Appian Cloud applications?

- A. In the event of a system failure, your Appian instance will be restored and available to your users in less than 15 minutes, having lost no more than the last 1 minute worth of data.
- B. Data and transactions are continuously replicated across the active nodes to achieve redundancy and avoid single points of failure.
- C. An Appian Cloud HA instance is composed of multiple active nodes running in different availability zones in different regions.
- D. A typical Appian Cloud HA instance is composed of two active nodes.

Answer: A,B

Explanation:

Comprehensive and Detailed In-Depth Explanation:

High Availability (HA) in Appian Cloud is designed to ensure that applications remain operational and data integrity is maintained even in the face of hardware failures, network issues, or other disruptions. Appian's Cloud Architecture and HA documentation outline the benefits, focusing on redundancy, minimal downtime, and data protection. The question asks for two advantages, and the options must align with these core principles.

Option B (Data and transactions are continuously replicated across the active nodes to achieve redundancy and avoid single points of failure):

This is a key advantage of HA. Appian Cloud HA instances use multiple active nodes to replicate data and transactions in real-time across the cluster. This redundancy ensures that if one node fails, others can take over without data loss, eliminating single points of failure. This is a fundamental feature of Appian's HA setup, leveraging distributed architecture to enhance reliability, as detailed in the Appian Cloud High Availability Guide.

Option D (In the event of a system failure, your Appian instance will be restored and available to your users in less than 15 minutes, having lost no more than the last 1 minute worth of data):

This is another significant advantage. Appian Cloud HA is engineered to provide rapid recovery and minimal data loss. The Service Level Agreement (SLA) and HA documentation specify that in the case of a failure, the system failover is designed to complete

within a short timeframe (typically under 15 minutes), with data loss limited to the last minute due to synchronous replication. This ensures business continuity and meets stringent uptime and data integrity requirements.

Option A (An Appian Cloud HA instance is composed of multiple active nodes running in different availability zones in different regions):

This is a description of the HA architecture rather than an advantage. While running nodes across different availability zones and regions enhances fault tolerance, the benefit is the resulting redundancy and availability, which are captured in Options B and D. This option is more about implementation than a direct user or operational advantage.

Option C (A typical Appian Cloud HA instance is composed of two active nodes):

This is a factual statement about the architecture but not an advantage. The number of nodes (typically two or more, depending on configuration) is a design detail, not a benefit. The advantage lies in what this setup enables (e.g., redundancy and quick recovery), as covered by B and D.

The two advantages-continuous replication for redundancy (B) and fast recovery with minimal data loss (D)-reflect the primary value propositions of Appian Cloud HA, ensuring both operational resilience and data integrity for users.

The two advantages of having High Availability (HA) for Appian Cloud applications are:

B . Data and transactions are continuously replicated across the active nodes to achieve redundancy and avoid single points of failure. This is an advantage of having HA, as it ensures that there is always a backup copy of data and transactions in case one of the nodes fails or becomes unavailable. This also improves data integrity and consistency across the nodes, as any changes made to one node are automatically propagated to the other node.

D). In the event of a system failure, your Appian instance will be restored and available to your users in less than 15 minutes, having lost no more than the last 1 minute worth of data. This is an advantage of having HA, as it guarantees a high level of service availability and reliability for your Appian instance. If one of the nodes fails or becomes unavailable, the other node will take over and continue to serve requests without any noticeable downtime or data loss for your users.

NEW QUESTION # 44

You are in a backlog refinement meeting with the development team and the product owner. You review a story for an integration involving a third-party system. A payload will be sent from the Appian system through the integration to the third-party system. The story is 21 points on a Fibonacci scale and requires development from your Appian team as well as technical resources from the third-party system. This item is crucial to your project's success. What are the two recommended steps to ensure this story can be developed effectively?

- **A. Break down the item into smaller stories.**
- B. Acquire testing steps from QA resources.
- **C. Maintain a communication schedule with the third-party resources.**
- D. Identify subject matter experts (SMEs) to perform user acceptance testing (UAT).

Answer: A,C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

This question involves a complex integration story rated at 21 points on the Fibonacci scale, indicating significant complexity and effort. Appian Lead Developer best practices emphasize effective collaboration, risk mitigation, and manageable development scopes for such scenarios. The two most critical steps are:

Option C (Maintain a communication schedule with the third-party resources):

Integrations with third-party systems require close coordination, as Appian developers depend on external teams for endpoint specifications, payload formats, authentication details, and testing support. Establishing a regular communication schedule ensures alignment on requirements, timelines, and issue resolution. Appian's Integration Best Practices documentation highlights the importance of proactive communication with external stakeholders to prevent delays and misunderstandings, especially for critical project components.

Option D (Break down the item into smaller stories):

A 21-point story is considered large by Agile standards (Fibonacci scale typically flags anything above 13 as complex). Appian's Agile Development Guide recommends decomposing large stories into smaller, independently deliverable pieces to reduce risk, improve testability, and enable iterative progress. For example, the integration could be split into tasks like designing the payload structure, building the integration object, and testing the connection-each manageable within a sprint. This approach aligns with the principle of delivering value incrementally while maintaining quality.

Option A (Acquire testing steps from QA resources): While QA involvement is valuable, this step is more relevant during the testing phase rather than backlog refinement or development preparation. It's not a primary step for ensuring effective development of the story.

Option B (Identify SMEs for UAT): User acceptance testing occurs after development, during the validation phase. Identifying SMEs is important but not a key step in ensuring the story is developed effectively during the refinement and coding stages.

By choosing C and D, you address both the external dependency (third-party coordination) and internal complexity (story size),

ensuring a smoother development process for this critical integration.

NEW QUESTION # 45

As long as you follow the steps of our ACD-301 quiz torrent, your mastery of knowledge will be very comprehensive and you will be very familiar with the knowledge points. This will help you pass the exam more smoothly. The ACD-301 learning materials are of high quality, mainly reflected in the adoption rate. As for our ACD-301 exam question, we guaranteed a higher passing rate than that of other agency. More importantly, we will promptly update our ACD-301 Quiz torrent based on the progress of the letter and send it to you. 99% of people who use our ACD-301 quiz torrent has passed the exam and successfully obtained their certificates, which undoubtedly show that the passing rate of our ACD-301 exam question is 99%. So our product is a good choice for you. Choose our ACD-301 learning materials, you will gain a lot and lay a solid foundation for success.

ACD-301 Free Brain Dumps: <https://www.itexamdownload.com/ACD-301-valid-questions.html>

So the certificate of this ACD-301 practice exam is the same thing. It will be cost-saving and time-consuming for all examinees to choose ACD-301 test dumps to clear exams. If the ACD-301 braindumps products fail to deliver as promised, then you can get your money back. At the same time, ACD-301 preparation baindumps can keep pace with the digitized world by providing timely application. You won't get any telephone harassment or receiving junk E-mails after purchasing our ACD-301 study guide.

Encourage a high-carbohydrate diet. That might be true, but you're in the minority. So the certificate of this ACD-301 Practice Exam is the same thing. It will be cost-saving and time-consuming for all examinees to choose ACD-301 test dumps to clear exams.

[Technology] Appian ACD-301 Exam Dumps For Good Success 2026

If the ACD-301 braindumps products fail to deliver as promised, then you can get your money back. At the same time, ACD-301 preparation braindumps can keep pace with the digitized world by providing timely application.

You won't get any telephone harassment or receiving junk E-mails after purchasing our ACD-301 study guide.
