IBM MQ v9.4 Administrator - Professional Sample Questions (Q103-Q108):

NEW QUESTION # 103

In scenarios where multiple applications need to process messages from the same queue simultaneously, which IBM MQ feature ensures that messages are distributed among consumers without duplication, and how does it maintain data integrity?

- A. Clustering replicates messages to all queue managers, which ensures each consumer processes every message.
- B. Queue Grouping distributes messages among multiple consumers so that each message is consumed by only one application, maintaining message integrity.
- C. Transactional queues automatically discard messages after the first consumer reads them.
- D. Shared queues allow all consumers to read every message, which may lead to duplication.

Answer: B

Explanation:

Queue Grouping ensures each message is delivered to only one consumer in a group, allowing parallel processing without duplication, maintaining data integrity.

NEW QUESTION # 104

When designing a messaging solution using IBM MQ in a multi-platform enterprise environment, which configuration is recommended to ensure that messages sent from applications running on different operating systems maintain integrity and are delivered in the exact order they were sent without loss or duplication?

- A. Using point-to-point queues with local transaction coordination
- B. Using non-persistent message queues with load-balanced channels
- **C. Implementing clustered queue managers with shared queues and persistent messaging**
- D. Using publish/subscribe model with durable subscriptions

Answer: C

Explanation:

Clustered queue managers with persistent messaging guarantee message order, integrity, and delivery across platforms, making them the preferred choice in multi-platform environments requiring reliability.

NEW QUESTION # 105

IBM MQ supports message affinity, where related messages must be processed together. In which business use case is message affinity most critical to avoid logical inconsistency?

- A. Sending weather updates to multiple subscribers in real-time
- B. Broadcasting stock market prices to different trading applications
- C. Logging system events across different servers for monitoring
- **D. Processing items of a customer's order where all related items must be handled by the same application instance**

Answer: D

Explanation:

Message affinity ensures related messages are processed together, such as items in a single order, to maintain business logic consistency.

NEW QUESTION # 106

Which IBM MQ feature allows messages to be stored safely in a queue even if the queue manager or network fails, ensuring that no messages are lost during transmission between distributed systems?

- A. Non-persistent messaging
- B. Synchronous messaging
- C. Asynchronous messaging
- **D. Persistent messaging**

Answer: D

Explanation:

Persistent messaging ensures that messages are written to disk, so they survive queue manager crashes or network failures, guaranteeing reliable delivery.

NEW QUESTION # 107

Which explanation accurately describes IBM MQ's handling of large message payloads, including segmentation into multiple parts, tracking of message segments, and reassembly by the consuming application to ensure data integrity and correct processing of complex or bulky data?

- A. MQ requires the application to manually split and track messages outside of MQ
- B. MQ splits large messages but delivers them randomly without reassembly
- **C. Large messages are segmented into smaller parts, tracked using segment numbers and identifiers, and reassembled by the consuming application to ensure correct processing**
- D. MQ cannot handle messages larger than a fixed size and discards excess data

Answer: C

Explanation:

IBM MQ can segment large messages into multiple parts. Each segment is tracked, and consuming applications reassemble them to maintain data integrity and ensure complete, accurate processing of large payloads.
