Reliable Salesforce Development-Lifecycle-and-Deployment-Architect Test Materials & Certified Development-Lifecycle-and-Deployment-Architect Questions

The Salesforce Development-Lifecycle-and-Deployment-Architect dumps are given regular update checks in case of any update. We make sure that candidates are not preparing for the Salesforce Development-Lifecycle-and-Deployment-Architect exam from outdated and unreliable Development-Lifecycle-and-Deployment-Architect study material. Itcerttest offers you a free demo version of the Salesforce Development-Lifecycle-and-Deployment-Architect Dumps. This way candidates can easily check the validity and reliability of the Development-Lifecycle-and-Deployment-Architect exam products without having to spend time.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q19-Q24):

NEW QUESTION # 19

Universal Containers (UC) is considering implementing a minor change policy for a series of low-risk user stories that are commonly received by the UC admins. The policy would allow admins to make these changes directly in production. UC does not have continuous integration/continuous delivery (CI/CD) in place.

Which three best practices should the architect suggest UC follow for their new change policy? Choose 3 answers

- A. All changes should still be tested.
- B. Downstream environments will not be automatically updated when production changes.
- C. Minor changes should be thoroughly documented and follow some type of standard cadence.
- D. CI/CD is required in to successfully manage minor changes.
- E. Minor changes do not need to be documented and can be made at any time.

Answer: A,B,C

Explanation:

Minor changes should be thoroughly documented and follow some type of standard cadence, as this can help maintain the audit trail and visibility of the changes. All changes should still be tested, even if they are minor, as they can have unexpected impacts on other parts of the system or introduce bugs or security issues.

Downstream environments will not be automatically updated when production changes are made, so it is important to have a strategy to keep them in sync and avoid conflicts or overwrites. Minor changes do not need to be documented and can be made at any time is a wrong statement, as it can lead to poor governance and lack of accountability. CI/CD is not required to successfully manage minor changes, although it can help automate and streamline the process. See Application Lifecycle and Deployment for more details.

NEW QUESTION # 20

Universal Containers has a deadline to retire a business -critical application that will no longer be supported on a specific date. What should an Architect recommend?

- A. Agile Methodology
- B. Executive Leadership
- C. Requirements Traceability Matrix
- D. Business Continuity Plan

Answer: D

NEW QUESTION # 21

The CTO at UniversalContainers is complaining to the software development managers that he has no visibility of their teams' work status.

What two software development methodologies should an architect suggest to solve this issue, and why?

Choose 2 answers

- A. Scrum, because openness is one of the five core Scrum values.
- B. Waterfall, because it defines a fixed schedule and duration for each activity.
- C. Kanban, because one of its basic elements is to make everything visible, creating consistent transparency of work items

- D. DevOps, because monitoring and logging practices help you stay informed of performance in real time.

Answer: A,C

Explanation:

Two software development methodologies that an architect should suggest to solve the issue of visibility are Scrum and Kanban. Scrum is based on the value of openness, which means that the team members and stakeholders share information and feedback regularly and transparently. Kanban is based on the principle of making everything visible, which means that the team uses a visual board to track the progress and status of the work items. Waterfall is not a good methodology for visibility, as it does not allow for frequent communication and feedback. DevOps is not a methodology, but a culture and practice that aims to improve collaboration and delivery across the software development lifecycle.

NEW QUESTION # 22

Universal Containers requires that all sandboxes that have not been recently refreshed must also receive the newest changes to production. This must be done before any functionality from that environment can be moved to production. Which deployment tool would allow this deployment process to be managed in an automated fashion?

- A. Change Sets
- **B. Force.com Migration Tool**
- C. Force.com IDE
- D. Workbench

Answer: B

Explanation:

Explanation

The best deployment tool for UC to use to manage their deployment process in an automated fashion is the Force.com Migration Tool, as it is a command-line tool that uses the Metadata API to deploy components from one org to another, and can be integrated with version control systems and continuous integration servers. Option A is not a good choice, as Workbench is a web-based tool that does not support automation or scripting. Option C is not a good choice, as Change Sets are a point-and-click tool that require manual steps to create and deploy. Option D is not a good choice, as Force.com IDE is a desktop tool that does not support automation or scripting.

NEW QUESTION # 23

Universal Containers business users often observe that newly released features are resulting in other previously existing and stable functionality being broken. Which approach should an Architect recommend to prevent regression?

- A. Utilize the developer console to run test suites for the affected functionality
- B. Utilize Salesforce Apex Hammer to automatically test all functionality
- **C. Utilize unit and functional test automation as part of a continuous integration strategy**
- D. Freeze development of new features and re -architect the system to remove the bugs

Answer: C

Explanation:

Explanation

This is the correct answer because utilizing unit and functional test automation as part of a continuous integration strategy can prevent regression by ensuring that the code and configuration are always tested and validated before deployment. Utilizing the developer console to run test suites is not sufficient and may not cover all the functionality. Utilizing Salesforce Apex Hammer is not a feasible option as it is an internal tool that Salesforce uses to test customer orgs before major releases. Freezing development of new features and re-architecting the system is not a realistic or cost-effective approach to prevent regression.

NEW QUESTION # 24

.....

By clearing different Salesforce exams, you can easily land your dream job. If you are looking to find high paying jobs, then Salesforce certifications can help you get the job in the highly reputable organization. Our Development-Lifecycle-and-Deployment-Architect exam materials give real exam environment with multiple learning tools that allow you to do a selective study and will help

you to get the job that you are looking for. Moreover, we also provide 100% money back guarantee on our Development-Lifecycle-and-Deployment-Architect Exam Materials, and you will be able to pass the Development-Lifecycle-and-Deployment-Architect exam in short time without facing any troubles.
