Age and the admission of the Glasgow Coma Scale (GCS) are important diagnostic factors in TBI. Which GCS score describes a severe TBI?

- A) 13-15
- B) 12-13
- C) 9-12
- D) 3-8

D) 3-8

The GCS is scored between 3 and 15, 3 being the worst and 15 the best.

Which term describes recurrent, intrusive thoughts or impulses?

- A) Hallucinations
- B) Compulsions
- C) Obsessions

Obsessions are recurrent and persistent thoughts, impulses, or images that cause distressing emotions such as anxiety or disgust.

D) Delusions

C) Obsessions

Obsessions are recurrent and persistent thoughts, impulses, or images that cause distressing emotions such as anxiety or disgust.

During an intake interview with a 26-year-old man diagnosed with generalized anxiety disorder, the FNP might observe what type of behavior?

- A) An inflated sense of self
- B) Constant relation to future events
- C) Inability to concentrate and irritability when questioned

Impaired concentration and irritability are major characteristics of GAD.

D) Nervousness and fear of the FNP during the interview

C) Inability to concentrate and irritability when questioned

Impaired concentration and irritability are major characteristics of GAD.

The FNP would expect which symptoms in a patient with a diagnosis of schizophrenia?

- A) High energy with varying sleep patterns and non stop conversation.
- B) Extreme and frequent mood swings with hyperactivity and difficulty concentrating.

The Practical-Applications-of-Prompt certification is the way to go in the modern WGU era. Success in the WGU Practical Applications of Prompt QFO1 exam of this certification plays an essential role in an individual's future growth. Nowadays, almost every tech aspirant is taking the test to get Practical-Applications-of-Prompt certification and find well-paying jobs or promotions. But the main issue that most of the candidates face is not finding updated WGU Practical-Applications-of-Prompt Practice Questions to prepare successfully for the WGU Practical-Applications-of-Prompt certification exam in a short time.

## WGU Practical Applications of Prompt QFO1 Sample Questions (Q15-Q20):

### NEW QUESTION # 15

A person is preparing for an upcoming speech and wants to use generative AI to help prepare for the speech. What should the person do before writing a prompt?

- A. Upload a personal audio sample
- B. Choose a scripting language
- C. Identify the goal of the speech
- D. Write a rough draft of the speech

**Answer: C**

Explanation:

The most critical step in the "pre-prompting" phase is the clear identification of the objective. Before interacting with a generative AI, the user must identify the goal of the speech. This foundational step dictates every other element of the prompt, including the persona, tone, and specific constraints. For example, a speech intended to persuade a group of investors requires a radically different linguistic approach than a speech intended to toast a friend at a wedding.

By identifying the goal first, the user can construct a prompt that provides the AI with a clear "definition of success." In practical applications, this is often referred to as the "Intent" phase. If a user skips this and goes straight to writing a draft or providing samples, the AI may generate content that is stylistically correct but fundamentally misses the mark regarding the intended outcome. Clear goals allow the user to evaluate the AI's output critically-checking if the generated text actually serves the purpose of informing, persuading, entertaining, or inspiring. Without a defined goal, prompt engineering becomes a trial-and-error process rather than a strategic exercise.

### NEW QUESTION # 16

Which task can be accomplished with the data cleaning capabilities of generative AI?

- A. Identifying inaccuracies
- B. Reducing total volume
- C. Drawing valid conclusions
- D. Identifying underlying bias

**Answer: A**

Explanation:

Generative AI models, specifically Large Language Models (LLMs), are highly effective at identifying inaccuracies within a dataset during the data cleaning phase. When provided with a dataset and a prompt to "check for consistency" or "identify anomalies," the AI can cross-reference the data points against its internal knowledge base or the logical rules established in the prompt. For example, if a list of "US States" includes "London," the AI can flag this as an inaccuracy.

This capability extends to identifying spelling errors, formatting inconsistencies (e.g., dates written in multiple formats), and logical contradictions. While AI can help in identifying bias (Option D), that is usually considered a higher-level "auditing" task rather than a standard "cleaning" task. Identifying inaccuracies is a foundational step in the data pipeline; by cleaning the data first, the user ensures that any subsequent analysis or "conclusion drawing" (Option C) is based on high-quality, reliable information. In prompt engineering, this is often performed using the "Self-Correction" or "Reviewer" pattern, where one prompt generates data and a second prompt is used specifically to identify and fix any factual or structural inaccuracies within that output.

### NEW QUESTION # 17

Which strategy is effective for a company to promote the ethical use of AI?

- A. Foster collaboration among diverse stakeholders to address ethical challenges

- B. Use an AI system to evaluate job applicants based on fair and ethical criteria
- C. Require employees to use an AI model to make a decision for any ethical dilemma
- D. Encourage users to ethically evaluate AI responses using their personal data

**Answer: A**

Explanation:

The most effective strategy for promoting ethical AI is to foster collaboration among diverse stakeholders.

Ethics in AI is not a purely technical problem that can be "solved" with code; it is a socio-technical challenge that requires input from various perspectives, including ethicists, legal experts, social scientists, engineers, and, most importantly, the communities affected by the AI.

Diverse collaboration helps identify "blind spots" that a homogenous technical team might miss. For example, a developer might not realize that a specific data feature is a proxy for race or gender, but a sociologist or a community advocate might recognize it immediately. By bringing these voices together, a company can develop "Ethics by Design" frameworks that proactively address bias, transparency, and safety issues before the AI is deployed. This approach aligns with the principle of "Multidisciplinary Oversight," ensuring that the AI's goals are aligned with human values. Relying purely on the AI to solve its own ethical dilemmas (Option A) is dangerous, as the AI lacks a true moral compass. Instead, human-led collaboration ensures that technology remains a servant to societal well-being.

### NEW QUESTION # 18

A person wants to use AI to make a technical document easier to comprehend. Which prompt engineering solution is most effective to achieve this goal?

- A. Ask the model to create another version with "read and summarize"
- **B. Include reading-level limitations with "at a tenth-grade reading level"**
- C. Give a list of appropriate words with the phrase "using these words"
- D. Correctly instruct the model with the keywords "translating" and "document"

**Answer: B**

Explanation:

The most effective way to optimize AI for clarity and comprehension is to include reading-level limitations.

While "summarizing" (Option B) shortens the text, it doesn't necessarily make the remaining language simpler. However, specifying a "tenth-grade reading level" (or "Explain it like I'm five") provides the AI with a very specific linguistic constraint. It forces the model to swap complex jargon for common synonyms, use shorter sentence structures, and avoid passive voice.

This technique is a form of Output Constraint. Reading levels are well-defined metrics that AI models can emulate because they have been trained on vast amounts of graded educational material. By setting this boundary, the user ensures the output is accessible to a broader audience without losing the core technical meaning. In practical professional settings—such as translating a medical white paper for a patient or a legal contract for a small business owner—this type of prompting is essential. It transforms dense, "impenetrable" text into actionable information, demonstrating how specific constraints can be used to reformat and simplify complex data sets effectively.

### NEW QUESTION # 19

A bank uses AI to detect fraud in financial transactions. What is the AI capability that enables this functionality?

- A. Contextual understanding
- B. Identity verification
- C. Misinformation identification
- **D. Pattern identification**

**Answer: D**

Explanation:

In the financial sector, the primary utility of AI for fraud detection is its superior ability for pattern identification. Financial transactions generate massive streams of data, most of which follow a predictable

"normal" pattern for any given user. AI models are trained to establish a baseline of these standard behaviors—such as typical spending amounts, geographical locations, and frequency of purchases. When a transaction occurs that deviates significantly from these established patterns, the AI flags it as potential fraud.

This process is fundamentally about detecting anomalies within a dataset. While identity verification and contextual understanding are

useful in banking, they are sub-components or different processes entirely.

Pattern identification allows the system to analyze variables across millions of transactions simultaneously, identifying microscopic correlations that might suggest stolen credit card or a sophisticated money-laundering scheme. Because fraudsters are constantly evolving their tactics, AI systems use machine learning to adapt to new patterns of illicit behavior. This capability is what makes AI an indispensable tool for real-time risk management, as it can process and evaluate the legitimacy of a transaction in milliseconds, a task that would be impossible for human auditors to perform at scale.
