Latest CAD Exam Experience & CAD New APP Simulations

You don't have to spend all your energy to the exam because our CAD learning questions are very efficient. Only should you spend a little time practicing them can you pass the exam successfully. In addition, the passing rate of our CAD Study Materials is very high, and we are very confident to ensure your success. And we can claim that our CAD exam braindumps will help you pass the exam if you study with our CAD practice engine.

ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q181-Q186):

NEW QUESTION # 181
Which one of the following is the baseline behavior of a table in a privately-scoped application?

- A. Only artifacts in the table's application can read from the table
- B. Any Business Rule can read, write, delete, and update from the table
- C. The table and its data are not accessible using web services
- D. All application scopes can read from the table

Answer: D

Explanation:
https://docs.servicenow.com/bundle/rome-application-development/page/build/applications/concept/c_DefaultDesignAccessPermissions.html The baseline behavior of a table in a privately-scoped application is that all application scopes can read from the table. A privately-scoped application is an application that restricts write access to its tables and resources to scripts within the same scope. However, read access is allowed by default for all scopes, unless the administrator explicitly denies it using an Access Control rule. This allows for data sharing between different applications while maintaining data integrity and security. References: [Product Documentation | ServiceNow], [Advantages of Scoped Applications in ServiceNow]

NEW QUESTION # 182
What field type would you select if you want to query records from another table on a form?

- A. Use the Reference field type.
- B. Use the String field type.
- C. Use the Phone Number field type.
- D. Use the Date field type.

Answer: A

Explanation:
In ServiceNow, to include data from another table within a form, the Reference field type is utilized. A Reference field creates a relationship between the current table and another table by storing a reference to a record in the target table. This allows users to select a record from the referenced table and display related information seamlessly within the form.
* A. Use the Date field type: This is incorrect. The Date field type is designed to store date values and does not facilitate referencing records from other tables.
* B. Use the Phone Number field type: This is incorrect. The Phone Number field type is intended for storing phone number data and does not support referencing other table records.
* C. Use the String field type: This is incorrect. The String field type stores text data and does not inherently provide functionality to reference records from other tables.
* D. Use the Reference field type: This is correct. The Reference field type is specifically designed to create a link to a record in another table, enabling the incorporation of related data into the form.
For example, in the Incident table, the "Caller" field is a reference to the User [sys_user] table, allowing the selection of a user as the caller for the incident. This setup ensures data consistency and leverages existing records without data duplication.
For more detailed information, refer to the official ServiceNow documentation on Reference Fields.

NEW QUESTION # 183
When configuring a REST Message, the Endpoint is:

- A. The commands to the REST script to stop execution
- B. The response from the provider indicating there is no data to send back
- C. Information about the format of the returned data
- D. The URI of the data to be accessed, queried, or modified

Answer: D

Explanation:
When configuring a REST Message, the Endpoint is:
The URI of the data to be accessed, queried, or modified. This is the correct answer because the Endpoint is the part of the REST Message that specifies the location and the resource of the REST provider. The Endpoint is composed of the base URL and the resource path, which can include query parameters or variables. For example, the Endpoint for a REST Message that retrieves the weather information for a city from a web service could be https://api.openweathermap.org/data/2.5/weather?q=London.
The following are not correct definitions of the Endpoint when configuring a REST Message:
The commands to the REST script to stop execution. This is not correct because the commands to the REST script to stop execution are not part of the REST Message, but of the Scripted REST API, which is a feature that allows users to create custom REST endpoints on the ServiceNow platform. The commands to the REST script to stop execution are methods of the RESTAPIResponse object, such as setStatusCode, setError, or complete.
Information about the format of the returned dat
a. This is not correct because the information about the format of the returned data is not part of the Endpoint, but of the HTTP headers or the Accept field of the REST Message. The HTTP headers or the Accept field can be used to specify the content type of the response, such as JSON, XML, or HTML.
The response from the provider indicating there is no data to send back. This is not correct because the response from the provider indicating there is no data to send back is not part of the Endpoint, but of the HTTP status code or the response body of the REST Message. The HTTP status code or the response body can be used to indicate the result of the REST request, such as 200 OK, 404 Not Found, or 500 Internal Server Error. Reference: REST Messages, Scripted REST APIs

NEW QUESTION # 184

Which of the following is NOT a way to install an application on a ServiceNow instance?

- A. Download and install an application from the ServiceNow Share web site
- B. Install an application from the Application Repository
- C. Select the Copy button on the application record
- D. Download and install a third-party application from the ServiceNow Store

Answer: C

Explanation:
There is no "copy" button on the application record (at least I couldn't see one). Also, see here:https://docs.servicenow.com/bundle/sandiego-application-development/page/build/applications/reference/r_

NEW QUESTION # 185
In a Business Rule, which one of the following returns true if the currently logged in user has the admin role?

- A. gs.hasRoleExactly('admin')
- B. g_form.hasRoleExactly('admin')
- C. gs.hasRole('admin')
- D. g_form.hasRole('admin')

Answer: C

Explanation:
Business Rule is server-side, so it uses GlideSystem API. gs.hasRoleExactly doesn't exist In a Business Rule, the following returns true if the currently logged in user has the admin role:
* gs.hasRole('admin'). This is the correct answer because gs is the GlideSystem object, which provides methods for performing system operations, and hasRole is a method that checks if the current user has the specified role. For example, gs.hasRole('admin') will return true if the current user has the admin role, and false otherwise.
The following do not return true if the currently logged in user has the admin role in a Business Rule:
* g_form.hasRoleExactly('admin'). This is not correct because g_form is the GlideForm object, which provides methods for manipulating forms, and hasRoleExactly is a method that checks if the current user has exactly the specified role and no other roles. For example, g_form.hasRoleExactly('admin') will return true if the current user has only the admin role, and false if the current user has the admin role and any other role.
* g_form.hasRole('admin'). This is not correct because g_form is the GlideForm object, which provides methods for manipulating forms, and hasRole is a method that checks if the current user has the specified role or any role that contains the specified role. For example, g_form.hasRole('admin') will return true if the current user has the admin role or any role that contains the admin role, such as admin_ui or admin_script.
* gs.hasRoleExactly('admin'). This is not correct because gs is the GlideSystem object, which provides methods for performing system operations, and hasRoleExactly is not a valid method of the gs object.
There is no method that checks if the current user has exactly the specified role and no other roles in the gs object. References: Business Rules, GlideSystem, GlideForm

NEW QUESTION # 186
.....

The Certified Application Developer-ServiceNow (CAD) certification is a valuable credential that every ServiceNow professional should earn it. The CAD certification exam offers a great opportunity for beginners and experienced professionals to demonstrate their expertise. With the Certified Application Developer-ServiceNow (CAD) certification exam everyone can upgrade their skills and knowledge. There are other several benefits that the ServiceNow CAD exam holders can achieve after the success of the Certified Application Developer-ServiceNow (CAD) certification exam.
