### Lpi LPIC-3 Exam 305: Virtualization and Containerization Sample Questions (Q78-Q83):

#### NEW QUESTION # 78

What does IaaS stand for?

- A. Integration as a Service
- B. Intelligence as a Service
- C. Instances as a Service
- **D. Infrastructure as a Service**
- E. Information as a Service

**Answer: D**

#### NEW QUESTION # 79

Which of the following statements are true about container-based virtualization? (Choose two.)

- **A. Different containers may use different distributions of the same operating system.**
- B. Container-based virtualization relies on hardware support from the host system's CPU.
- **C. All containers run within the operating system kernel of the host system.**
- D. Each container runs its own operating system kernel.
- E. Linux does not support container-based virtualization because of missing kernel APIs.

**Answer: A,C**

Explanation:

Container-based virtualization is a method of operating system-level virtualization that allows multiple isolated user spaces (containers) to run on the same host system<sup>1</sup>. Each container shares the same operating system kernel as the host, but has its own file system, libraries, and processes<sup>2</sup>. Therefore, the statements A and C are false, as containers do not run their own kernels or rely on hardware support from the CPU. The statement E is also false, as Linux does support container-based virtualization through various technologies, such as cgroups, namespaces, LXC, Docker, etc<sup>1,2</sup>. The statement B is true, as different containers may use different distributions of the same operating system, such as Debian, Ubuntu, Fedora, etc., as long as they are compatible with the host kernel<sup>3</sup>. The statement D is also true, as all containers run within the operating system kernel of the host system, which provides isolation and resource management for them<sup>2</sup>. References:

#### NEW QUESTION # 80

What is the primary advantage of container virtualization compared to traditional virtualization?

- **A. Faster startup times**
- B. Lower resource utilization
- C. Improved isolation between applications
- D. Greater hardware compatibility

**Answer: A**

Explanation:

The primary advantage of container virtualization is faster startup times. Containers share the host OS kernel and do not require booting a full guest operating system, allowing them to start in seconds or milliseconds.

While containers also use fewer resources, the most commonly cited primary benefit in documentation is rapid startup and scalability, making B the correct answer.

### NEW QUESTION # 81

What is the primary purpose of Vagrant's "Vagrantfile" configuration file?

- A. To provide a list of available software packages
- B. To specify cloud provider details
- C. To specify the developer's name and contact information
- **D. To define the virtual machine's hardware requirements**

**Answer: D**

Explanation:

The Vagrantfile is the core configuration file used by Vagrant to define and control virtual machine environments. According to Vagrant documentation, its primary purpose is to describe the virtual machine configuration, including hardware-related settings such as memory size, CPU count, networking, synced folders, and provisioning instructions.

The Vagrantfile allows developers to declare VM characteristics in a reproducible and portable way, ensuring consistent development environments across teams. While it can also reference providers and provisioning tools, its fundamental role is defining how the virtual machine should be created and configured.

Options B and C are unrelated to Vagrant's purpose, and option D is too narrow, as Vagrantfile usage is not limited to cloud providers.

Therefore, the correct answer is A.

### NEW QUESTION # 82

If a Dockerfile contains the following lines:

```
WORKDIR /
```

```
RUN cd /tmp
```

```
RUN echo test > test
```

where is the file test located?

- A. /tmp/test on the system running docker build.
- B. /root/test within the container image.
- C. /ting/test within the container image.
- **D. /test within the container image.**
- E. test in the directory holding the Dockerfile.

**Answer: D**

Explanation:

Explanation

The WORKDIR instruction sets the working directory for any subsequent RUN, CMD, ENTRYPOINT, COPY and ADD instructions that follow it in the Dockerfile<sup>1</sup>. The RUN instruction executes commands in a new layer on top of the current image and commits the results<sup>2</sup>. The RUN cd command does not change the working directory for the next RUN instruction, because each RUN command runs in a new shell and a new environment<sup>3</sup>. Therefore, the file test is created in the root directory (/) of the container image, not in the /tmp directory. References:
