Learning is sometimes extremely dull and monotonous, so few people have enough interest in learning, so teachers and educators have tried many ways to solve the problem. Research has found that stimulating interest in learning may be the best solution. Therefore, the Category-7A-General-and-Household-Pest-Control Study Materials' focus is to reform the rigid and useless memory mode by changing the way in which the Category-7A-General-and-Household-Pest-Control exams are prepared. Category-7A-General-and-Household-Pest-Control study materials combine knowledge with the latest technology to greatly stimulate your learning power.

OCPE Pesticide Applicator Category 7A General and Household Pest Control Exam Sample Questions (Q71-Q76):

NEW QUESTION # 71

Pesticide labels often specify the type of respirator to be used by its TC designation. Which of the following is the chemical cartridge respirator designation?

- A. TC-19
- B. TC-84
- C. TC-23

Answer: C

Explanation:

The TC designation is assigned by the National Institute for Occupational Safety and Health (NIOSH) to classify respirators. TC-23 designates chemical cartridge respirators, which are used to protect against specific gases and vapors, as specified on pesticide labels for Category 7A applications. The General Pest Management: Guide for Commercial Applicators - Category 7A (Chapter 3: Pesticide Safety) notes that TC-23 respirators are commonly required for pesticide applications involving volatile chemicals. Option A (TC-84) refers to particulate respirators (e.g., N95 masks). Option C (TC-19) is not a valid designation for pesticide use.

NEW QUESTION # 72

Bedbugs go through:

- A. Four distinct stages of development (egg, larva, pupa, and adult)
- B. Gradual metamorphosis (nymphs similar to adult stage)
- C. Just two stages (egg and adult)

Answer: B

Explanation:

Bedbugs undergo gradual metamorphosis, also known as incomplete metamorphosis, which includes three stages: egg, nymph, and adult. Nymphs resemble smaller versions of adults and go through several molts before reaching maturity. The General Pest Management: Guide for Commercial Applicators - Category 7A (Chapter 7: Bedbugs) confirms this life cycle. Option A (four stages: egg, larva, pupa, adult) describes complete metamorphosis, typical of insects like beetles, not bedbugs. Option C (two stages) is incorrect, as nymph stages are a critical part of bedbug development.

NEW QUESTION # 73

The certified commercial pesticide applicator responsible for a commercial pesticide operator must be able to be at the application site within a reasonable amount of time, meaning:

- A. 24 hours
- B. Three hours
- C. Eight hours

Answer: B

Explanation:

In New Jersey, the NJDEP Pesticide Control Program outlines the responsibilities of a certified commercial pesticide applicator supervising a pesticide operator. According to NJDEP regulations (N.J.A.C. 7:30-6.2), a certified applicator must be able to

respond to the application site within a

"reasonable amount of time" if they are not physically present. The definition of "reasonable" in this context is clarified in training materials and NJDEP guidance as being within three hours to ensure proper oversight, especially in case of emergencies or issues during application. This aligns with the need for timely supervision to ensure compliance with safety and application standards for general and household pest control under Category 7A. Eight hours or 24 hours would be too long to address potential issues effectively, such as spills, misapplications, or safety concerns.

NEW QUESTION # 74

To help prevent pesticide resistance, IPM suggests:

- A. Increased dosage to knock out initial infestation
- B. Routine preventative spraying
- C. Use of multiple components in the control of a pest population

Answer: C

Explanation:

Pesticide resistance occurs when pests develop tolerance to a pesticide due to overuse. IPM strategies, as outlined in the General Pest Management: Guide for Commercial Applicators - Category 7A (Chapter 4: IPM), recommend using multiple components (e.g., rotating pesticide classes, incorporating non-chemical methods like sanitation or traps) to control pests and reduce resistance risk. Option A (routine spraying) increases resistance by overexposing pests to the same chemical. Option C (increased dosage) can exacerbate resistance and is not an IPM practice.

NEW QUESTION # 75

Power sprayers are not used for:

- A. Interior house ant and roach applications
- B. Termite applications
- C. Exterior perimeter and lawn applications

Answer: A

Explanation:

Power sprayers are designed for high-volume applications over large areas, such as exterior perimeter and lawn applications (Option B) or termite applications (Option C), where large amounts of pesticide are needed. However, they are not suitable for interior house ant and roach applications (Option A), as these require precise, low-volume treatments (e.g., crack-and-crevice applications) using handheld sprayers, as noted in the General Pest Management: Guide for Commercial Applicators - Category 7A (Chapter 5: Pesticide Application).

NEW QUESTION # 76

.....

With the pass rate reaching 98.75%, our Category-7A-General-and-Household-Pest-Control test materials have gained popularity in the international market. Many candidates have recommended our products to their friends. In addition, Category-7A-General-and-Household-Pest-Control exam materials are edited by skilled professionals, and they possess the professional knowledge for the exam, therefore you can use the exam materials at ease. Free demo for Category-7A-General-and-Household-Pest-Control Exam Dumps are available, and you can have a try before buying, so that you can have a better understanding of what you are going to buy.
