Veeam Certified Engineer v12 Sample Questions (Q155-Q160):

NEW QUESTION # 155

An administrator removes a server's proxy role using the Veeam Backup & Replication console.

What happens to the server following the administrator's action?

- A. The server remains in the backup infrastructure inventory.
- B. The server takes the role of a repository server.
- C. The server is deleted from the configuration database.
- D. The server becomes a failback network proxy.

Answer: A

NEW QUESTION # 156

Why is it recommended to have at least one backup proxy server in each site when defining a replica Job?

- A. The proxies allow automatic WAN acceleration.
- B. The proxies allow for no VM snapshots during transit.
- C. The proxies allow replication automatic restart after failure.
- D. The proxies enable a stable connection for VM data transfer across sites.

Answer: D

Explanation:

Explanation

A backup proxy is a component that acts as a data mover in the backup infrastructure. It retrieves data from the source and transfers it to the target¹. When defining a replica job, it is recommended to have at least one backup proxy server in each site to enable a stable connection for VM data transfer across sites². This way, the backup proxy at the source site can communicate with the backup proxy at the target site and send data over the WAN without affecting the production hosts². The other options are not correct for explaining why backup proxies are recommended. The proxies do not allow automatic WAN acceleration, as this is a function of the WAN accelerators³. The proxies do not allow for no VM snapshots during transit, as the replication process requires creating a snapshot of the source VM to read its data. The proxies do not allow replication automatic restart after failure, as this is a setting of the replication job.

NEW QUESTION # 157

Is it possible to switch between backup modes in a backup job?

- A. No, if you want to create backups using another mode, you have to create another backup Job.
- B. Yes, the new mode will transform all existing backups in the appropriate way and continue creating backups in the same backup repository.
- C. Yes, the new mode leaves existing backups as they are and continues creating backups in the same backup repository.
- D. Yes, but in this case, you will have to specify a new backup repository.

Answer: C

NEW QUESTION # 158

Select the correct description of a synthetic full backup.

- A. A synthetic full backup will generate a new VBK file by getting data from the hypervisor
- B. A synthetic full backup will update the existing VBK with data from the hypervisor and generate a new VRB file
- C. A synthetic full backup combines a VBK file with one or more VIB files from a repository to generate a new VBK file

- D. A synthetic full backup combines a VIB file with one or more VBK files from a repository to generate a new VBK file

Answer: A

NEW QUESTION # 159

The administrator of a VMware environment backed up by Veeam Backup & Replication has a critical server that has crashed and will not reboot. They were able to bring it back online quickly using Instant VM Recovery so people could continue to work. What else is required to complete the recovery?

- A. Merge delta file
- **B. Migrate to production**
- C. Commit tailback
- D. Commit failover

Answer: B

Explanation:

After using Instant VM Recovery to bring a critical crashed server back online quickly, the final step required to complete the recovery process is A: Migrate to production. Instant VM Recovery allows a VM to run directly from the backup file in a temporary location, enabling rapid recovery and minimal downtime. However, because the VM is running in this provisional state, it's essential to migrate it back to the production environment to ensure long-term stability and performance. The "Migrate to production" operation involves moving the running VM from the backup storage to the production storage, typically involving a storage vMotion in VMware environments or a similar process in other hypervisors. This step ensures that the VM is fully restored to its original or a new production environment, solidifying the recovery and allowing the VM to operate as part of the normal infrastructure once again.
