SAP Certified Associate - SAP Business Data Cloud Sample Questions (Q14-Q19):

NEW QUESTION # 14

Why would you choose the "Validate Remote Tables" feature in the SAP Datasphere repository explorer?

- A. To detect if remote tables are defined that are not used in Views
- B. To preview data of remote tables
- C. To identify structure updates of the remote sources
- D. To test if data has been replicated completely

Answer: C

Explanation:

The "Validate Remote Tables" feature in the SAP Datasphere repository explorer is primarily used to identify structure updates of the remote sources. When a remote table is created in Datasphere, it establishes a metadata connection to a table or view in an external source system. Over time, the structure of the source object (e.g., column additions, deletions, data type changes) might

change. The "Validate Remote Tables" function allows you to compare the metadata currently stored in Datasphere for the remote table with the actual, current metadata in the source system. If discrepancies are found, Datasphere can highlight these structural changes, prompting you to update the remote table's definition within Datasphere to match the source. This ensures that views and data flows built on these remote tables continue to function correctly and align with the underlying source structure, preventing data access issues or incorrect data interpretations.

NEW QUESTION # 15

What is the role of SAP Databricks in SAP Business Data Cloud?

Please choose the correct answer.

Response:

- A. To integrate ABAP function modules for data type conversions in SAP-based data sources
- B. To provide a graphical interface for the business user who will develop data models
- C. To enhance intelligent applications by adding planning functions
- **D. To enrich data products with AI and machine learning**

Answer: D

NEW QUESTION # 16

Which SAP Analytics Cloud feature uses natural language processing?

- **A. Just Ask feature**
- B. Digital boardroom
- C. Smart insight
- D. Data analyzer

Answer: A

Explanation:

The "Just Ask" feature in SAP Analytics Cloud (SAC) is a prime example of its integration with natural language processing (NLP). This innovative AI-powered capability allows users to interact with their data by simply typing questions in plain, everyday language, rather than needing to navigate complex menus or understand underlying data structures. For instance, a user might type "Show me sales by region for the last quarter," and "Just Ask" will interpret this query, identify relevant dimensions and measures, and automatically generate an appropriate visualization or insight. This significantly democratizes data analysis, making it accessible to a wider audience, including business users who may not have extensive technical skills. By leveraging NLP, "Just Ask" bridges the gap between human language and data queries, transforming how users discover and consume insights within SAC, ultimately accelerating decision-making.

NEW QUESTION # 17

You need to export some data from your story into a .csv file. What do you do?

Please choose the correct answer.

Response:

- **A. Choose a widget that displays data and use its More Actions menu.**
- B. From the File area of the menu bar, choose Save as and change the file type to CSV.
- C. From the File area of the menu bar, choose Export.

Answer: A

NEW QUESTION # 18

What is the main storage type of the object store in SAP Business Data Cloud?

- **A. SAP HANA data lake files**
- B. SAP BW/4HANA DataStore objects (advanced)
- C. SAP BW/4HANA InfoObjects
- D. SAP HANA extended tables

Answer: A

Explanation:

The primary storage type for the object store within the SAP Business Data Cloud (BDC) architecture is SAP HANA data lake files. SAP BDC is designed to handle vast amounts of diverse data, including semi-structured and unstructured data, which is efficiently stored in a data lake. The SAP HANA data lake, specifically its file storage component, provides a highly scalable and cost-effective solution for retaining raw, historical, and detailed data. This contrasts with traditional relational databases (like SAP HANA extended tables) or data warehousing constructs (like BW/4HANA DataStore objects or InfoObjects), which are optimized for structured, aggregated data and specific query patterns. The object store's reliance on data lake files in BDC underscores its capability to manage enterprise-wide data regardless of its structure, making it suitable for a wide range of analytical workloads, including those involving machine learning and advanced analytics where raw data access is crucial.
