ISC CISSP certification exam is among those popular IT certifications. It is also the dream of ambitious IT professionals. This part of the candidates need to be fully prepared to allow them to get the highest score in the CISSP Exam, make their own configuration files compatible with market demand.

ISC CISSP Certification Exam is an essential certification for professionals who want to advance their careers in information security and cybersecurity. Certified Information Systems Security Professional (CISSP) certification demonstrates the candidate's expertise in various domains of information security and is recognized by a wide range of organizations worldwide. CISSP Exam is rigorous and challenging, but the certification is well worth the effort for professionals who are serious about advancing their careers in information security.

ISC CISSP Advanced Testing Engine & CISSP Valid Dumps Book

All these three ISC CISSP exam questions formats are easy to use and compatible with all devices, operating systems, and browsers. You can install and run these three CISSP exam practice test questions easily and start ISC CISSP Exam Preparation without wasting further time. The CISSP exam practice questions will ace your Certified Information Systems Security Professional (CISSP) CISSP exam preparation and prepare you for the final CISSP exam.

The CISSP certification is recognized globally and is highly valued by employers. It is a requirement for many job positions in the information security field, including security analyst, security consultant, and security manager. According to the International

Information System Security Certification Consortium (ISC)², the organization that offers the CISSP Certification, there are currently over 150,000 CISSP certified professionals around the world.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q364-Q369):

NEW QUESTION # 364
Compared to a traditional network, which of the following is a security-related benefit that software-defined networking (SDN) provides?

- A. Reduced hardware footprint and cost
- B. Reduced network latency when scaled
- C. Centralized network administrator control
- D. Centralized network provisioning

Answer: C

NEW QUESTION # 365
Which of the following describes the order in which a digital forensic process is usually conducted?

- A. Ascertain legal authority, conduct investigation, report results, and agree upon examination strategy
- B. Agree upon examination strategy, ascertain legal authority, conduct examination, and report results
- C. Agree upon examination strategy, ascertain legal authority, report results, and conduct examination
- D. Ascertain legal authority, agree upon examination strategy, conduct examination, and report results

Answer: D

Explanation:
The digital forensic process is usually conducted in the following order: ascertain legal authority, agree upon examination strategy, conduct examination, and report results. This order ensures that the forensic process is lawful, ethical, and effective. The first step is to ascertain legal authority, which means to verify that the forensic examiner has the proper authorization, consent, or warrant to perform the examination. This step is crucial to avoid violating any laws or privacy rights of the data owner or custodian. The second step is to agree upon examination strategy, which means to define the scope, objectives, and methods of the examination. This step is important to establish the expectations, roles, and responsibilities of the forensic examiner and the client or stakeholder. The third step is to conduct examination, which means to collect, preserve, analyze, and document the digital evidence. This step is essential to perform the forensic tasks in a systematic, accurate, and reliable manner. The fourth step is to report results, which means to present the findings, conclusions, and recommendations of the examination. This step is necessary to communicate the forensic outcomes in a clear, concise, and understandable way. References: CISSP All-in-One Exam Guide, Eighth Edition, Chapter 6:

NEW QUESTION # 366
When implementing a data classification program, why is it important to avoid too much granularity?

- A. It will be difficult to assign ownership to the data
- B. The process will require too many resources
- C. It will be difficult to apply to both hardware and software
- D. The process will be perceived as having value

Answer: B

Explanation:
When implementing a data classification program, it is important to avoid too much granularity, because the process will require too many resources. Data classification is the process of assigning a level of sensitivity or criticality to data based on its value, impact, and legal requirements. Data classification helps to determine the appropriate security controls and handling procedures for the data. However, data classification is not a simple or straightforward process, as it involves many factors, such as the nature, context, and scope of the data, the stakeholders, the regulations, and the standards. If the data classification program has too many levels or categories of data, it will increase the complexity, cost, and time of the process, and reduce the efficiency and effectiveness of the data protection. Therefore, data classification should be done with a balance between granularity and simplicity, and follow the

principle of proportionality, which means that the level of protection should be proportional to the level of risk.

NEW QUESTION # 367

In an environment where there is not full administrative control over all network connected endpoints, such as a university where non-corporate devices are used, what is the BEST way to restrict access to the network?

- A. Use of virtual local area networks (VLAN) to segregate users.
- B. Use a clientless Network Access Control (NAC) solution
- C. Use a client-based Network Access Control (NAC) solution.
- D. Use switch port security to limit devices connected to a particular switch port.

Answer: D

NEW QUESTION # 368

What is the most critical characteristic of a biometric identifying system?

- A. Accuracy
- B. Reliability
- C. Storage requirements
- D. Perceived intrusiveness

Answer: A

Explanation:
The principle of biometrics is to use some unique characteristic to identify whether the person is who they say they are. Biometrics works by matching or verifying a person's unique traits with stored data in two categories: physiological characteristics and those that are behavioral. Physical indicators include iris, fingerprint, facial, or hand geometry. Behavior types are usually voiceprints, keystroke dynamics and handwritten signatures. Most biometric technologies require special hardware to convert analog measurements of signatures, voices, or patterns of fingerprints and palm prints, to digital measurement, which computers can read.
The biggest characteristic and problem of biometric implementations today is the accuracy, we must see the level of accuracy before buying a solution, because the technology is not perfect at this time and it can be erroneous sometimes.
