질문 # 18

An administrator has a NetApp AFF cluster with two SVMs serving LUNs. SnapMirror active sync is configured, and a disaster recovery test is planned over the weekend.

Which NetApp ONTAP command will show the status of this test?

- A. snapmirror config-replication status show
- B. network interface failover-groups show
- C. storage failover hwassist show
- **D. snapmirror failover show**

정답: D

설명:

To check the status of a SnapMirror active sync disaster recovery test on a NetApp ONTAP cluster, you would use the command `snapmirror failover show`. This command provides the necessary details about the failover status, helping administrators verify if the disaster recovery test is proceeding as expected. It displays the status of the failover groups and their readiness, which is essential for confirming the effectiveness of the disaster recovery setup.

For more detailed information on SnapMirror commands and their usage, refer to:

* NetApp Documentation - SnapMirror Commands (NetApp Community) (NetApp Community).

질문 # 19

A customer has a two-node NetApp AFF ASA cluster in an environment with a Cisco Fibre Channel SAN and Cisco UCS Servers. The customer wants to upgrade the UCS Server BIOS and the Cisco NX-OS system running on the switches.

Which NetApp resource should be consulted to check compatibility with the new versions?

- A. Hardware Universe
- B. BlueXP digital advisor
- **C. Interoperability Matrix Tool (IMT)**
- D. Active IQ Config Advisor

정답: C

설명:

When planning to upgrade the UCS Server BIOS and Cisco NX-OS system running on the switches in a NetApp AFF ASA cluster environment, the Interoperability Matrix Tool (IMT) is the recommended resource to check compatibility with the new versions. The IMT provides detailed compatibility information for various hardware and software components, ensuring that the planned upgrades will not cause any interoperability issues.

질문 # 20

What is the maximum size for a LUN in NetApp ONTAP 9.14.1 software?

- A. 16TiB
- B. 300TiB
- C. 64TiB
- **D. 128TiB**

정답: D

설명:

In NetApp ONTAP 9.14.1 software, the maximum size for a LUN is 128TiB. This limit ensures that large datasets can be stored and managed efficiently within a single LUN, catering to the needs of high-capacity SAN environments.

질문 # 21

An administrator finishes an installation of a new NetApp ASA system at the customer site and creates a new LUN. The customer wants to restrict the access of the LUN to specific UFs.

Where would the administrator configure this?

- A. Portset
- B. Selective LUN Map
- C. igroup
- D. Zoning

정답: C

설명:

To restrict access to a newly created LUN to specific hosts, the administrator should configure the igroup (initiator group). An igroup is used to control which initiators (hosts) are allowed to access specific LUNs.

This ensures that only authorized hosts can access the storage, enhancing security and access control.

For more details, refer to:

* NetApp Documentation on iGroups (NetApp).

질문 # 22

What should an administrator use to protect an Oracle RAC Automatic Storage Management (ASM) instance to ensure automated restores?

- A. NetApp SnapCenter plugin
- B. Availability groups
- C. Consistency groups
- D. CLI snapshots and clones

정답: A

설명:

To protect an Oracle RAC Automatic Storage Management (ASM) instance and ensure automated restores, the recommended tool is the NetApp SnapCenter plugin. SnapCenter provides comprehensive backup, restore, and clone capabilities for Oracle databases, including those using ASM. It integrates tightly with Oracle RAC environments and automates the entire data protection process, ensuring that backups are consistent and restores are efficient and reliable.

For more details, refer to:

* NetApp Documentation on SnapCenter for Oracle (NetApp).
