The TestPassKing is offering real, valid, and error-free InsuranceSuite-Analyst exam practice test questions in three different formats. These formats are InsuranceSuite-Analyst PDF Dumps Files, desktop practice test software, and web-based practice test software. All these three InsuranceSuite-Analyst exam question formats contain the real InsuranceSuite-Analyst exam practice questions that help you to prepare well for the final Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam exam.

Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q96-Q101):

NEW QUESTION # 96

A well written user story follows the INVEST model. INVEST is an acronym that stands for:

- A. Independent, Negotiable, Valuable, Estimable, Small, Testable
- B. Independent, Negotiable, Viable, Elaborate, Software, Technology
- C. Investigate, Negotiable, Viable, Elaborate, Small, Technology
- D. Investigate, Negotiable, Valuable, Estimable, Software, Testable

Answer: A

Explanation:

Comprehensive and Detailed Explanation:

The INVEST model, originally created by Bill Wake, is the industry-standard checklist used by Guidewire Business Analysts to assess the quality of a User Story.

* Independent: The story should be self-contained, allowing it to be developed and tested separately from other stories to avoid dependencies that block progress.

* Negotiable: The story is not a closed contract; it is an invitation to a conversation (Story Huddle) where details can be adjusted between the BA, Developer, and QA.

* Valuable: It must deliver value to the business or the user (not just a technical task).

* Estimable: The team must have enough information to size the effort. If it cannot be estimated, it usually needs further clarification or breakdown.

* Small: It should be small enough to be completed within a single sprint (typically 2-3 days of work).

* Testable: It must have clear acceptance criteria (often in Given-When-Then format) that allow the QA team to verify when the story is "Done." Why other options are incorrect:

* B, C, D: These contain incorrect terms such as "Viable," "Elaborate," "Software," "Technology," or "Investigate," which are not part of the standard INVEST acronym.

NEW QUESTION # 97

An insurer is developing a new Commercial Property line of business and aims to leverage as much pre-built content as possible to accelerate the implementation. Which of the following are specifically designed to provide ready-to-use policy products or a standardized process and application for developing a policy product?

- A. User Story Handbooks, which provide best practices for documenting requirements
- B. Legacy System Adapters, designed for migrating historical data
- C. Guidewire GO products, which are approved collections of pre-built product model content

- D. Product Adoption Resources, which offer guidance on implementing features
- E. Advanced Product Designer (APD)
- F. Guidewire Studio files, for direct configuration changes

Answer: C,E

Explanation:

Guidewire provides several accelerators to help insurers implement new lines of business efficiently while minimizing custom development. When the goal is to leverage pre-built content or standardized tooling for product development, the correct choices are Guidewire GO products and the Advanced Product Designer (APD).

Guidewire GO products (Option B) are approved collections of pre-built product model content delivered by Guidewire. They include ready-to-use coverages, conditions, exclusions, and clauses that align with common industry practices. GO products allow insurers to rapidly stand up new policy products while reducing risk and implementation time. Analysts benefit because requirements can be validated against proven, standardized content rather than starting from a blank product model.

The Advanced Product Designer (APD) (Option F) is a Guidewire-provided application and process for designing and maintaining policy products. APD enables structured, guided product configuration with governance, versioning, and consistency across environments. It supports a standardized approach to product development, making it especially valuable for organizations managing multiple lines of business or frequent product changes.

The remaining options do not meet the stated objective. Guidewire Studio files (Option A) are used for technical configuration, not as pre-built product accelerators. Legacy System Adapters (Option C) support data migration, not product development. User Story Handbooks (Option D) and Product Adoption Resources (Option E) provide guidance and best practices but do not deliver ready-to-use products or standardized product-building tools.

NEW QUESTION # 98

During the Inception phase for a new marine insurance product, an elaboration session is being held.

What are two key responsibilities of participants in these sessions to help achieve the objectives of the workshop?

- A. Writing Gosu code to implement complex business logic
- B. Reviewing the standard process flows and how they tie back to Guidewire product functionality
- C. Formalizing the sprint backlog with tasks assigned to individual developers
- D. Creating detailed UI mockups for all base system screens
- E. Focusing on the happy path of the requirement first, then edge cases
- F. Performing end-to-end regression testing of the configured solution

Answer: B,E

Explanation:

Elaboration sessions conducted during the Inception phase are designed to validate scope, align stakeholders, and ensure a shared understanding of how Guidewire Insurance Suite supports business needs. These sessions are exploratory and collaborative rather than execution-focused.

Two key participant responsibilities during elaboration sessions are focusing on the happy path first, followed by edge cases, and reviewing standard process flows in relation to Guidewire product functionality, making Options A and B correct.

Starting with the happy path allows participants to validate the primary business scenario without unnecessary complexity. Once the core flow is understood and agreed upon, edge cases and exceptions can be discussed in context. This approach aligns with Guidewire's recommended practice of leveraging out-of-the-box functionality before introducing complexity.

Reviewing standard process flows and mapping them to Guidewire functionality ensures that stakeholders understand what the product already provides. This helps avoid over-customization and supports the "configure over customize" principle central to Guidewire implementations.

The remaining options are not objectives of elaboration sessions. Creating detailed UI mockups (Option C), formalizing sprint tasks (Option D), writing Gosu code (Option E), and performing regression testing (Option F) all occur in later phases of the project lifecycle.

Elaboration sessions are successful when they focus on understanding, validation, and alignment—setting the stage for efficient and predictable delivery.

NEW QUESTION # 99

_____ requirements are based on federal and/or state legislation that impact the project.

- A. Regulatory
- B. Privacy

- C. Business
- D. National Legislative

Answer: A

Explanation:

In Guidewire InsuranceSuite implementations, regulatory requirements are those driven by federal, state, or regional legislation that directly impact how insurance products are configured, processed, and administered. Therefore, Option A - Regulatory is the correct answer.

Regulatory requirements arise from laws and regulations governing insurance operations, such as rating rules, policy wording mandates, claims handling timelines, reporting obligations, and compliance with state-specific insurance departments. These requirements are non-negotiable and must be met to ensure legal compliance and avoid penalties or operational risk.

From an analyst perspective, regulatory requirements must be clearly identified and documented during requirements gathering and elaboration. They often influence product model configuration, business rules, validations, workflows, and reporting. In Guidewire projects, regulatory requirements frequently vary by jurisdiction, making them especially important for multi-state or multi-region implementations.

The other options are less accurate. Privacy requirements (Option B) are a subset of regulatory concerns but focus specifically on data protection and confidentiality rather than broader insurance legislation. "National Legislative" (Option C) is not a standard classification used in Guidewire methodology. Business requirements (Option D) reflect organizational goals and operational needs, not legal mandates.

Properly identifying regulatory requirements ensures that Guidewire InsuranceSuite configurations align with legal obligations and that compliance is built into the system from the outset rather than retrofitted later. This is a critical responsibility of the Business Analyst in regulated insurance environments.

NEW QUESTION # 100

A Business Analyst at PinnacleSure is preparing for an upcoming sprint. They are reviewing User Story Cards to ensure they accurately reflect the refined requirements.

User Story Cards are refined throughout a Guidewire project to capture changing business requirements and to specify what will be (or has been) _____ for the project.

- A. financially approved
- B. externally validated
- C. a testing strategy
- D. implemented by developers
- E. configured in the application
- F. the project plan

Answer: E

Explanation:

The correct answer is C. configured in the application .

In a Guidewire InsuranceSuite project, User Story Cards are used as living requirement artifacts. They are refined over time as the team gains clarity about business needs, product fit, configuration choices, and implementation details. Their purpose is not just to capture business intent at a high level, but also to describe how that intent is translated into solution behavior within the InsuranceSuite application.

This is why the phrase that best completes the statement is "configured in the application." In the Guidewire analyst approach, story cards help track what the project team intends to deliver and what has already been addressed in the system configuration. Since Guidewire implementations emphasize configuration of base product capabilities wherever possible, story cards are closely tied to application behavior and business functionality.

The other options do not fit the role of User Story Cards as accurately. A is incorrect because external validation may occur during review or testing, but that is not the core thing story cards specify. B is less precise because the Guidewire approach focuses first on what is configured in the product, not simply what developers implement. D is incorrect because a testing strategy is a separate project artifact, not the main content of a story card. E and F are also unrelated to the primary purpose of story cards.

So, in Guidewire terminology and project practice, User Story Cards are refined to reflect changing requirements and to specify what will be, or has been, configured in the application for the project.

NEW QUESTION # 101

.....

By years of diligent work, our experts have collected the frequent-tested knowledge into our InsuranceSuite-Analyst practice materials for your reference. By resorting to our InsuranceSuite-Analyst study guide, we can absolutely reap more than you have imagined before. We have clear data collected from customers who chose our InsuranceSuite-Analyst Actual Exam, the passing rate is 98-100 percent. So your chance of getting success will be increased greatly by our InsuranceSuite-Analyst learning quiz.
