Linux Foundation Certified GitOps Associate Sample Questions (Q28-Q33):

NEW QUESTION # 28
In GitOps, how is the Desired State stored?

- A. In a way that retains only the latest version.
- B. In a way that enforces immutability and versioning.
- C. In a way that permits direct modifications to live systems.
- D. In a way that enforces mutability and versioning.

Answer: B

Explanation:
The GitOps principle of Versioned and Immutable requires Desired State to be stored in a way that enforces immutability and versioning. This ensures every change is recorded, auditable, and reversible.
"Desired state must be kept in an immutable, version-controlled system. This guarantees a full history of changes and enables safe rollbacks." Thus, the correct answer is D.

NEW QUESTION # 29

What is the main difference between Terraform/OpenTofu and Ansible?

- A. Ansible is written in Golang, while Terraform/OpenTofu is written in Python.
- B. Terraform/OpenTofu uses a configuration language called CUE, while Ansible uses HCL.
- C. Terraform/OpenTofu is imperative in nature, while Ansible is declarative.
- D. Terraform/OpenTofu stores the state of each resource, while Ansible works in a fire-and-forget mode.

Answer: D

Explanation:
Terraform (or OpenTofu) uses a declarative model and maintains a state file to track the current status of resources, enabling it to plan and reconcile changes. Ansible, by contrast, is more procedural and executes tasks in a fire-and-forget manner, without tracking persistent resource state.
"Terraform maintains state for each managed resource, enabling planned, consistent changes. Ansible executes tasks without tracking resource state, working in a fire-and-forget model." Thus, the correct answer is B.

NEW QUESTION # 30

When using Kustomize, how are resources, configurations, and customizations commonly organized?

- A. Using a combination of folder directories and referenced folder/file paths.
- B. In separate configuration files for each resource.
- C. In a single configuration file.
- D. By specifying all resources inline in the customization file.

Answer: A

Explanation:
Kustomize is a GitOps tool for managing Kubernetes configurations declaratively. It uses a folder structure with configuration files and a kustomization.yaml file that references resources and overlays. This enables customization without modifying the base manifests.
"Kustomize allows customization of Kubernetes manifests by organizing resources in directories and referencing them through file paths in a kustomization file. This directory-based approach supports overlays, reusability, and modular configuration." Thus, the correct answer is D.

NEW QUESTION # 31

What is one of the key benefits of a pull-based reconciliation approach to configuration management?

- A. Agents can access the Desired State at any time, not only when an event is triggered.
- B. The CI has access credentials to the running system.
- C. Simplified troubleshooting and debugging processes.
- D. Immediate response time to configuration changes.

Answer: A

Explanation:
In GitOps, the pull-based reconciliation approach means that agents continuously monitor the Desired State in Git. Unlike push-based systems, which only act when triggered, pull-based systems can reconcile at any time, providing resilience, self-healing, and security (since no external system needs direct access to the cluster).
"In a pull-based model, reconciliation agents continuously fetch and compare the desired state, enabling self-healing and ensuring the desired configuration is accessible at all times." Thus, the correct answer is B.
References: GitOps Principles (CNCF GitOps Working Group), Pull vs. Push reconciliation models.

NEW QUESTION # 32

Manual updates are common causes of what?

- A. Changes in actual state leading to variance.
- B. Changes in actual state leading to drift.
- C. Changes in Desired State leading to failure.
- D. Changes in Desired State leading to drift.

Answer: B

Explanation:
In GitOps, thedesired stateis stored in Git. Manual updates applied directly to the cluster (via kubectl or APIs) change theactual statewithout updating Git. This introducesdriftbetween actual and desired state.
"Manual changes to the runtime environment cause the actual state to diverge from the desired state stored in Git. This drift must be detected and reconciled automatically." Thus, the correct answer isC.
