100% Pass Salesforce - Plat-Dev-301 Latest Test Question

The CertkingdomPDF is committed to acing the Salesforce Certified Platform Developer II - Multiple Choice (Plat-Dev-301) exam questions preparation quickly, simply, and smartly. To achieve this objective CertkingdomPDF is offering valid, updated, and real Salesforce Certified Platform Developer II - Multiple Choice (Plat-Dev-301) exam dumps in three high-in-demand formats. These Salesforce Certified Platform Developer II - Multiple Choice (Plat-Dev-301) exam questions formats are PDF dumps files, desktop practice test software, and web-based practice test software.

Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q99-Q104):

NEW QUESTION # 99

A user receives the generic "An internal server error has occurred" while interacting with a custom Lightning component. What should the developer do to ensure a more meaningful message?

- A. Add an onerror event handler to the tag.
- B. Add an error-view component to the markup.
- **C. Use an AuraHandledException in a try-catch block.**
- D. Use platform events to process the error

Answer: C

Explanation:

Use AuraHandledException in try-catch for custom errors. It enables sending meaningful, user-friendly error messages to the Lightning component.

NEW QUESTION # 100

Universal Containers uses Salesforce to track orders in an order__c object.

The order__c object has private organization-wide defaults. The order__c object has a custom field, Quality_Controller__c, that is a Lookup to User and is used to indicate that the specified User is performing quality control on the order__c.

What should be used to automatically give read only access to the User set in the Quality_Controller field?

- A. Record ownership
- **B. Apex managed sharing**
- C. Criteria-based sharing
- D. User managed sharing

Answer: B

Explanation:

Apex managed sharing provides a programmatic way to share records when the organization-wide default for an object is Private. The Quality_Controller__c field can be used within a trigger or class to share records with the specified user using Apex managed sharing.

NEW QUESTION # 101

An environment has two Apex triggers: an after-update trigger on Account and an after-update trigger on Contact.

The Account after-update trigger fires whenever an Account's address is updated, and it updates every associated Contact with that address. The Contact after-update trigger fires on every edit, and it updates every Campaign Member record related to the Contact with the Contact's state.

Consider the following: A mass update of 200 Account records' addresses, where each Account has 50 Contacts. Each Contact has one Campaign Member. This means there are 10,000 Contact records across the Accounts and 10,000 Campaign Member records across the contacts.

What will happen when the mass update occurs?

- A. The mass update of Account address will succeed, but the Contact address updates will fail due to exceeding number of records processed by DML statements.
- B. There will be no error and all updates will succeed, since the limit on the number of records processed by DML statements was not exceeded.
- **C. The mass update will fail, since the two triggers fire in the same context, thus exceeding the number of records processed by DML statements.**

- D. There will be no error, since each trigger fires within its own context and each trigger does not exceed the limit of the number of records processed by DML statements.

Answer: C

Explanation:

In this scenario, the governor limit for DML statements (150 DML operations and 10,000 DML rows per transaction) will be exceeded because the updates will cascade across related objects, significantly multiplying the number of records processed.
Apex Developer Guide

NEW QUESTION # 102

A developer wrote an Apex class to make several callouts to an external system.

If the URLs used in these callouts will change often, which feature should the developer use to minimize changes needed to the Apex class?

- A. Remote Site Settings
- B. Session Id
- C. Connected Apps
- **D. Named Credentials**

Answer: D

Explanation:

The correct feature to use is C, Named Credentials. Named Credentials are a secure way of storing the endpoint and authentication details for callouts to external services. When URLs change frequently, using Named Credentials allows you to manage the endpoint URL in one place without changing the Apex code.

Named Credentials

NEW QUESTION # 103

A developer is building a complex commission calculation engine in Apex that is called from an Opportunity trigger. During QA it was reported that the calculations are incorrect.

The developer has representative test data and passing test methods in their developer sandbox.

Which three tools or techniques could the developer use to execute the code and pause it at key lines to visually inspect values of various Apex variables?

Choose 3 answers

- **A. Developer Console**
- B. Workbench
- **C. Apex Interactive Debugger**
- **D. Apex Replay Debugger**
- E. Breakpoints

Answer: A,C,D

Explanation:

To debug and troubleshoot the commission calculation engine, a developer can use several tools provided by Salesforce to inspect and pause the execution of Apex code.

Apex Interactive Debugger: It allows real-time debugging of Apex code execution. With this tool, a developer can set breakpoints, step through code, inspect variables, and evaluate expressions.

Developer Console: Although the Developer Console does not allow interactive debugging, it does provide the ability to view logs that capture the execution of code. Debug logs can be inspected to understand the flow of execution and values of variables at different points in time.

Apex Replay Debugger: This tool is part of Salesforce Extensions for Visual Studio Code. It allows a developer to replay a debug log as if they are stepping through the code line by line, which can be very useful to inspect the state of variables at specific points in the execution.

Apex Interactive Debugger
