

Useful ISC Latest CISSP Braindumps - CISSP Free Download

What's more, part of that VerifiedDumps CISSP dumps now are free: <https://drive.google.com/open?id=1pUYsPmkxJXiwA7xJlqXCG-5SJqSKmlf>

In order to provide the most effective CISSP exam materials which cover all of the current events for our customers, a group of experts in our company always keep an close eye on the changes of the CISSP exam, and then will compile all of the new key points as well as the latest types of exam questions into the new version of our CISSP training engine. Do not lose the wonderful chance to advance with times. Just come and have a try on our CISSP study questions!

There is the registration process for ISC CISSP Certification Exam

ISC CISSP Certification Exam Registration ISC CISSP members may access the examination on-line for a reduced fee. To register, visit ISC CISSP Exam. To register for your exam online, you must provide certain information about yourself. There is no charge for this option. The information you provide will be used only to verify your identity and determine whether or not you are eligible to take the exam.

As elaborated in **CISSP Dumps**, you will be able to choose between three options:

- Register through a local testing center in the U.S. or Canada
- Register as an ISC Member
- Register as a Non-Member

CISSP New Study Guide, New CISSP Mock Test

In order to help you enjoy the best learning experience, our PDF CISSP study guide supports you download on your computers and print on papers. In this way, you can make the best use of your spare time. Whatever you are occupied with your work, as long as you really want to learn our CISSP test engine, you must be inspired by your interests and motivation. Once you print all the contents of our CISSP Practice Test on the paper, you will find what you need to study is not as difficult as you imagined before. Also, you can make notes on your papers to help you memorize and understand the difficult parts. Maybe you are just scared by yourself. Getting the CISSP certificate is easy with the help of our test engine. You should seize the opportunities of passing the exam.

ISC CISSP (Certified Information Systems Security Professional) exam is one of the most respected and sought-after certifications

in the field of information security. Certified Information Systems Security Professional (CISSP) certification is globally recognized and validates the knowledge and experience of professionals in the field of information security. The CISSP Certification Exam is designed for professionals who have at least five years of experience in the field of security and its aspects.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q312-Q317):

NEW QUESTION # 312

Without proper signal protection, embedded systems may be prone to which type of attack?

- A. Tampering
- B. Denial of Service (DoS)
- C. Brute force
- D. Information disclosure

Answer: D

Explanation:

The type of attack that embedded systems may be prone to without proper signal protection is information disclosure. Information disclosure is a type of attack that exposes or reveals sensitive or confidential information to unauthorized parties, such as attackers, competitors, or the public. Information disclosure can occur through various means, such as interception, leakage, or theft of the information. Embedded systems are systems that are integrated into other devices or machines, such as cars, medical devices, or industrial controllers, and perform specific functions or tasks. Embedded systems may communicate with other systems or devices through signals, such as radio frequency, infrared, or sound waves. Without proper signal protection, such as encryption, authentication, or shielding, embedded systems may be vulnerable to information disclosure, as the signals may be captured, analyzed, or modified by attackers, and the information contained in the signals may be compromised. Brute force, tampering, and denial of service are not the types of attack that embedded systems may be prone to without proper signal protection, as they are related to the guessing, alteration, or prevention of the access or functionality of the systems, not the exposure or revelation of the information. NEW QUESTION # 313

An online retail company has formulated a record retention schedule for customer transactions. Which of the following is a valid reason a customer transaction is kept beyond the retention schedule?

- A. Long term data mining needs
- B. Pending legal hold
- C. Useful for future business initiatives
- D. Customer makes request to retain

Answer: B

Explanation:

A valid reason for keeping a customer transaction beyond the retention schedule is a pending legal hold. A legal hold is a requirement or an order to preserve certain records or data that are relevant or potentially relevant to a legal matter, such as a lawsuit, an investigation, or an audit. A legal hold can override the normal record retention schedule or policy of an organization, and can mandate the organization to retain the records or data until the legal matter is resolved or the legal hold is lifted. A pending legal hold can be a valid reason for keeping a customer transaction beyond the retention schedule, as it can ensure the compliance, evidence, or liability of the organization or the customer. Long term data mining needs, customer makes request to retain, and useful for future business initiatives are not valid reasons for keeping a customer transaction beyond the retention schedule, as they are related to the business value, preference, or strategy of the organization or the customer, not the legal obligation or necessity of the organization or the customer. NEW QUESTION # 314

Match the functional roles in an external audit to their responsibilities.

Drag each role on the left to its corresponding responsibility on the right.

Select and Place:

□

Answer:

Explanation:

Explanation

NEW QUESTION # 315

In an organization where there are frequent personnel changes, non-discretionary access control using Role Based Access Control (RBAC) is useful because:

- A. the access controls are based on the individual's role or title within the organization.
- B. people need not use discretion
- C. the access controls are not based on the individual's role or title within the organization
- D. the access controls are often based on the individual's role or title within the organization

Answer: A

Explanation:

In an organization where there are frequent personnel changes, non-discretionary access control (also called Role Based Access Control) is useful because the access controls are based on the individual's role or title within the organization. You can easily configure a new employee access by assigning the user to a role that has been predefined. The user will implicitly inherit the permissions of the role by being a member of that role. These access permissions defined within the role do not need to be changed whenever a new person takes over the role. Another type of non-discretionary access control model is the Rule Based Access Control (RBAC or RuBAC) where a global set of rule is uniformly applied to all subjects accessing the resources. A good example of RuBAC would be a firewall. This question is a sneaky one, one of the choice has only one added word to it which is often. Reading questions and their choices very carefully is a must for the real exam. Reading it twice if needed is recommended.

Shon Harris in her book list the following ways of managing RBAC: Role-based access control can be managed in the following ways:

Non-RBAC Users are mapped directly to applications and no roles are used. (No roles being used)

Limited RBAC Users are mapped to multiple roles and mapped directly to other types of applications that do not have role-based access functionality. (A mix of roles for applications that supports roles and explicit access control would be used for applications that do not support roles)

Hybrid RBAC Users are mapped to multiapplication roles with only selected rights assigned to those roles.

Full RBAC Users are mapped to enterprise roles. (Roles are used for all access being granted)

NIST defines RBAC as:

Security administration can be costly and prone to error because administrators usually specify access control lists for each user on the system individually. With RBAC, security is managed at a level that corresponds closely to the organization's structure. Each user is assigned one or more roles, and each role is assigned one or more privileges that are permitted to users in that role. Security administration with RBAC consists of determining the operations that must be executed by persons in particular jobs, and assigning employees to the proper roles. Complexities introduced by mutually exclusive roles or role hierarchies are handled by the RBAC software, making security administration easier.

NEW QUESTION # 316

Which one of the following is NOT a component of a CC Protection Profile?

- A. Security objectives
- B. Threats against the product that must be addressed
- C. Product-specific security requirements
- D. Target of Evaluation (TOE) description

Answer: C

Explanation:

The correct answer is "Product-specific security requirements". Product-specific security requirements for the product or system are contained in the Security Target (ST).

Additional items in the PP are:

TOE security environment description

Assumptions about the security aspects of the product's expected use

Organizational security policies or rules

Application notes

Rationale
