VMware vSphere 8.x Advanced Design Sample Questions (Q13-Q18):

NEW QUESTION # 13

What does evaluating storage protocols in a given scenario involve?

- A. Determining the physical and storage connectivity topology.
- B. Ensuring that different storage segregation techniques are implemented in the vSphere environment.
- C. Identifying the network protocols required for vSphere networking.
- D. Selecting the most suitable storage protocol (e.g., NFS, iSCSI, Fibre Channel) based on specific requirements.

Answer: D

NEW QUESTION # 14

An architect is designing a VMware software-defined data center (SDDC) solution based on the following customer requirements:

- The solution must initially support 1,000 virtual machines
- The solution must scale to support the concurrent running of up to 5,000 virtual machines
- The production environment should be delivered across two data centers
- The solution should have a maximum tolerable downtime (MTD) of four hours
- The solution should have a monthly service availability target of 99.8%.

Which two assumptions could the architect make based on the information from the customer to help size the solution? (Choose two.)

- A. The size (CPU/RAM/storage) of the vSphere hosts
- B. The size (CPU/RAM/storage) of the average virtual machine
- C. The number of vSphere hosts in a cluster
- D. The guest operating system for each virtual machine
- E. The average resource utilization of a virtual machine

Answer: B,E

NEW QUESTION # 15

Which requirement would be classified as a functional requirement within the design documentation?

- A. The system must perform virtual machine backups through an API.
- B. The system must be able to scale to support 500 concurrent virtual machines.
- C. Virtual machines must be patched within one month of the patch release date.
- D. Virtual machines must be restarted within 30 minutes of a host failure.

Answer: B

NEW QUESTION # 16

A new vSphere platform is being created. The platform will host virtual machines that will run management services and line-of-business applications.

What should the architect consider when designing the number and type of clusters required?

- A. Auditing requirements for the virtual machines
- B. The level of isolation required between virtual machine classifications
- C. Maximum tolerable downtime
- D. Predicted platform growth

Answer: B

Explanation:

Since question is based upon number and types of cluster required.

NEW QUESTION # 17

An architect is documenting the logical design for a new vSphere solution. The following requirements have been provided to the architect by the customer for the design:

The solution must be deployed in two locations: DC1 and DC2

The solution must limit the impact radius of accidental changes by administrators The solution must meet a recovery time objective (RTO) of four (4) hours and recovery point objective (RPO) of 24 hours The solution must allow workloads to run in both DC1 and

DC2 during normal operations. The solution must allow workloads to be moved bi-directionally between DC1 and DC2. The solution must use hyper-converged infrastructure for the virtual machine storage. The customer has also confirmed that the network connection between DC1 and DC2 has a 10 Gbps bandwidth with a maximum round trip latency of 4 ms.

The architect recommends the following design decision:

Use separate clusters in DC1 and DC2 to form a multi-region design.

What should the architect include as justification for this design decision?

- A. Sufficient capacity must be deployed in both DC1 and DC2 to support all running virtual machines.
- **B. Using separate clusters mitigates the risk of an accidental change at the cluster level in DC1 from impacting DC2.**
- C. The network connection between DC1 and DC2 does not support the use of stretched clusters.
- D. Using separate clusters is the only configuration available that supports the RTO of four (4) hours.

Answer: B

Explanation:

Separate clusters in DC1 and DC2 provide logical isolation between the two data centers. This means that an accidental change or misconfiguration in one cluster (e.g., DC1) will not affect the other cluster (e.g., DC2).

This isolation meets the customer's requirement to limit the impact radius of accidental changes by administrators. By having separate clusters, the risk of cross-site or cross-cluster disruptions is minimized, ensuring better fault tolerance and administrative control.

NEW QUESTION # 18
