Because they are immensely useful and help you gain success in a CCCS-203b certification exam. More than ever, the professionals are now facing a highly competitive world to get their talent recognized enhancing their positions in their work environment. Such a milieu demands them to enrich their candidature more seriously. So the professionals work hard to maintain their quality and never fail in doing so. Braindumpsqa CCCS-203b Certification exams are the best option for any ambitious and ardent professional to make his continuation in his area of work intact.

By resorting to our CCCS-203b exam materials, we can absolutely reap more than you have imagined before. We have clear data collected from customers who chose our CCCS-203b practice braindumps, and the passing rate is 98-100 percent. So your chance of getting success will be increased greatly by our CCCS-203b study questions. Besides, the price of our CCCS-203b learning guide is very favourable even the students can afford it.

2026 Realistic Guaranteed CCCS-203b Questions Answers Help You Pass CCCS-203b Easily

For the purposes of covering all the current events into our CCCS-203b study guide, our company will continuously update our training materials. And after payment, you will automatically become the VIP of our company, therefore you will get the privilege to enjoy free renewal of our CCCS-203b practice test during the whole year. No matter when we have compiled a new version of our CCCS-203b Training Materials our operation system will automatically send the latest version of the CCCS-203b preparation materials for the exam to your email, all you need to do is just check your email then download it.

CrowdStrike CCCS-203b Exam Syllabus Topics:

Topic	Details
-------	---------

Topic 1	<ul style="list-style-type: none"> • Pre-Runtime Protection: This domain covers managing registry connections, selecting image assessment methods, and analyzing assessment reports to identify malware, CVEs, leaked secrets, Dockerfile misconfigurations, and vulnerabilities before deployment.
Topic 2	<ul style="list-style-type: none"> • Remediating and Reporting Issues: This domain addresses identifying remediation steps for findings, using scheduled reports for cloud security, and utilizing Falcon Fusion SOAR workflows for automated notifications.
Topic 3	<ul style="list-style-type: none"> • Findings and Detection Analysis: This domain covers evaluating security controls to identify IOMs, vulnerabilities, suspicious activity, and persistence mechanisms, auditing user permissions, comparing configurations to benchmarks, and discovering unmanaged public-facing assets.

CrowdStrike Certified Cloud Specialist Sample Questions (Q294-Q299):

NEW QUESTION # 294

A security analyst using CrowdStrike Falcon Cloud Workload Protection (CWP) notices unusual outbound traffic from a Kubernetes pod to an unknown external IP. The analyst needs to determine whether the traffic is malicious and identify the process responsible for the connection.

Which CrowdStrike Falcon feature should the analyst use to identify network connections at the process level?

- A. Falcon Sensor Network Visibility
- B. Falcon Identity Protection
- C. Falcon LogScale
- D. Falcon Sandbox

Answer: A

Explanation:

Option A: Falcon LogScale provides log analytics and can collect network event logs, but it does not provide real-time visibility into active network connections at the process level. It is useful for post-incident investigations but not for immediate runtime detection.

Option B: Identity Protection helps detect credential-based attacks and unauthorized access attempts but does not monitor network connections at the process level. It is designed for preventing identity-based threats rather than inspecting runtime network traffic.

Option C: This feature enables deep visibility into network connections at the process level within cloud workloads, including Kubernetes containers. It allows the analyst to identify the specific containerized process making the outbound connection, investigate its behavior, and detect potential threats.

Option D: Falcon Sandbox is used for analyzing suspicious files in an isolated environment to detect malware behavior. It does not monitor active network connections within Kubernetes workloads.

NEW QUESTION # 295

Which of the following automated remediation actions can CrowdStrike initiate within AWS when a threat is detected?

- A. Triggering a manual review of security logs by the AWS administrator.
- B. Automatically encrypting all EBS volumes in the AWS account.
- C. Deleting all IAM users associated with the compromised account.
- D. Restricting outbound traffic from a compromised instance by updating the Security Group rules.

Answer: D

Explanation:

Option A: Automated remediation can include modifying Security Group rules to block outbound traffic, effectively containing a compromised instance and preventing data exfiltration.

Option B: Deleting IAM users is a drastic action that could disrupt legitimate operations. Instead, automated remediation focuses on targeted containment, such as disabling compromised credentials.

Option C: Encryption is a preventive measure, not a remediation action. While encryption enhances security, it does not address active threats detected by CrowdStrike.

Option D: While log reviews are essential for analysis, they are not automated remediation actions. CrowdStrike automates responses like containment and traffic restriction, not manual reviews.

NEW QUESTION # 296

How does the CrowdStrike Identity Analyzer help administrators identify users with stale passwords that have not been changed for an extended period?

- A. By integrating with the cloud provider's activity logs to extract password change timestamps.
- **B. Using the Stale Credential Detection feature.**
- C. By generating periodic reminders to users to update their passwords.
- D. Through automated password expiration enforcement.

Answer: B

Explanation:

Option A: Password expiration enforcement is a policy-driven mechanism, not a detection feature.

The question specifically asks about identifying stale passwords, not enforcing policy compliance.

Option B: While integration with cloud provider logs is part of the Identity Analyzer's capabilities, this approach alone does not detect stale passwords effectively. Additional processing, such as the Stale Credential Detection feature, is required to analyze and identify such users.

Option C: The Stale Credential Detection feature of the CrowdStrike Identity Analyzer proactively identifies credentials, including passwords, that have not been updated within a specified time period. This is the most accurate and direct solution for the scenario.

Option D: Sending reminders may encourage users to change passwords, but it is not a detection mechanism for stale passwords. The question is about identifying stale credentials, not prompting updates.

NEW QUESTION # 297

Which of the following is the most critical step when configuring an automated remediation workflow in Falcon Fusion for AWS findings?

- A. Integrate AWS Security Hub with Falcon Fusion to detect findings.
- B. Ensure IAM roles in AWS grant unrestricted access for remediation actions.
- C. Configure the workflow to delete all flagged resources immediately upon detection.
- **D. Set up appropriate triggers and actions for specific AWS findings.**

Answer: D

Explanation:

Option A: Automatically deleting resources without evaluating their impact is risky. Automated remediation should take precise, context-aware actions rather than broad, potentially destructive ones.

Option B: Granting unrestricted IAM permissions violates the principle of least privilege and can expose the AWS environment to unnecessary risks. IAM permissions should be narrowly scoped for specific actions.

Option C: Automated remediation workflows require clear triggers (e.g., specific findings in AWS Security Hub) and actions (e.g., isolating instances or removing permissions) to function effectively. Configuring workflows with precise conditions ensures that remediation actions address relevant threats without unintended consequences.

Option D: While integration is necessary to collect AWS findings, it is not sufficient on its own to configure an automated remediation workflow. Integration is a preliminary setup step, not the critical configuration step.

NEW QUESTION # 298

An organization using CrowdStrike Falcon Cloud Security wants to exclude specific resources from automated security scans to reduce false positives and optimize scan efficiency. Which of the following is the correct method for configuring cloud security scan exclusion settings?

- **A. Define exclusion rules in the Falcon Cloud Security dashboard, specifying resource tags, accounts, or regions to exclude from scanning.**
- B. Modify the Falcon agent's configuration file on each cloud workload to disable scanning for selected resources.
- C. Configure IAM policies to block Falcon Cloud Security from accessing specific cloud storage buckets, thereby preventing scans.
- D. Use Kubernetes pod security policies (PSP) to prevent Falcon Cloud Security from scanning sensitive workloads.

Answer: A

Explanation:

Option A: While IAM policies can restrict access to certain cloud resources, they are not the correct method for configuring scan exclusions in Falcon Cloud Security. Using IAM policies in this way could inadvertently prevent security visibility rather than properly configuring exclusions.

Option B: The Falcon agent is primarily used for endpoint and workload protection but does not control Falcon cloud security scans, which operate at the cloud account level. Configuring agent settings would not prevent cloud security scans from occurring.

Option C: Falcon Cloud Security allows administrators to configure scan exclusions through the Falcon console, where they can define rules based on resource tags, cloud accounts, or regions.

This ensures that security scans avoid designated resources while still protecting the overall cloud environment. Exclusions can help reduce noise from security alerts and improve efficiency in large-scale environments.

Option D: Kubernetes Pod Security Policies (PSPs) control security settings for pods but do not affect Falcon Cloud Security's cloud-native scanning capabilities. PSPs define restrictions for running containers, such as preventing privileged access, but they do not manage scan exclusions.
