

New CISSP Exam Simulator Pass Certify| High-quality CISSP Dump: Certified Information Systems Security Professional (CISSP)

P.S. Free 2026 ISC CISSP dumps are available on Google Drive shared by It-Tests: <https://drive.google.com/open?id=13VxwyJFMQwtYQxNld8gOGMv5JdLH6EIr>

When preparing to take the ISC CISSP exam dumps, knowing where to start can be a little frustrating, but with It-Tests ISC CISSP practice questions, you will feel fully prepared. Using our Certified Information Systems Security Professional (CISSP) (CISSP) practice test software, you can prepare for the increased difficulty on Certified Information Systems Security Professional (CISSP) (CISSP) exam day. Plus, we have various question types and difficulty levels so that you can tailor your Certified Information Systems Security Professional (CISSP) (CISSP) exam dumps preparation to your requirements.

ISC CISSP (Certified Information Systems Security Professional) Certification Exam is a challenging and respected certification that can help professionals to advance their careers in the field of information security. Certified Information Systems Security Professional (CISSP) certification covers a wide range of topics related to information security and requires candidates to have a minimum of five years of professional experience in the field. The benefits of obtaining the certification are numerous, including career advancement opportunities, access to a network of professionals, and recognition by organizations and businesses worldwide.

ISC CISSP Exam is intended for experienced information security professionals who are responsible for designing, implementing, and managing information security programs. Candidates must have at least five years of professional experience in the field of information security, with a minimum of three years of experience in one or more of the eight domains covered by the exam. Certified Information Systems Security Professional (CISSP) certification is suitable for security consultants, security managers, security auditors, security analysts, and other professionals who are responsible for ensuring the security of information assets.

ISC CISSP Dump & Latest CISSP Exam Duration

You can enjoy free update for 365 days if you buying CISSP study guide of us, that is to say, in the following year you can obtain the latest information for the exam timely. And the update version for CISSP exam dumps will be sent to your email automatically. You just need to receive and exchange your learning ways in accordance with the new changes. In addition, CISSP Study Materials are compiled by experienced experts, and they are quite familiar with the exam center, therefore the quality can be guaranteed. We also have online and offline chat service, if you have any questions about CISSP exam dumps, you can consult us.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q1151-Q1156):

NEW QUESTION # 1151

Which of the following can be defined as THE unique attribute used as a unique identifier within a given table to identify a tuple?

- A. secondary key
- B. candidate key
- C. primary key
- D. foreign key

Answer: C

Explanation:

The following answers were NOT correct:

Candidate Key: A candidate key is a combination of attributes that can be uniquely used to identify a database record without any extraneous data. Each table may have one or more candidate keys. One of these candidate keys is selected as the table primary key.

Foreign Key: A foreign key is a field in a relational table that matches the primary key column of another table. The foreign key can be used to cross-reference tables.

Secondary key: The term secondary key is a key that is used strictly for data-retrieval purposes. A secondary key is sometimes defined as a "data item value that identifies a set of records." It is important to note that a secondary key does not need to have unique values in a table; in this respect, secondary keys differ from primary keys (and candidate keys and superkeys).

References:

A candidate key is an attribute that is a unique identifier within a given table.

Source: KRUTZ, Ronald L. & VINES, Russel D., The CISSP Prep Guide: Mastering the Ten Domains of Computer Security, 2001, John Wiley & Sons, Page 45.

Candidate Key Ref: <http://databases.about.com/cs/specificproducts/g/candidate.htm>

Feedback from Jerry: A candidate key is one of several alternative columns in a table that may be chosen as a primary key. The PRIMARY KEY IS the unique identifier. The foundation of a relational database is the establishment and reliance on a unique primary key, not candidate keys. Primary key is a more correct answer to this question than candidate key.

NEW QUESTION # 1152

Which of the following is the MAIN goal of a data retention policy?

- A. Ensure that data recovery can be done on the data.
- B. Ensure the integrity and availability of data for a predetermined amount of time.
- C. Ensure the integrity and confidentiality of data for a predetermined amount of time.
- D. Ensure that data is destroyed properly.

Answer: C

Explanation:

A data retention policy is a document that specifies the rules and guidelines for how long and under what conditions an organization should retain its data. The main goal of a data retention policy is to ensure the integrity and confidentiality of data for a predetermined amount of time. Integrity means that the data is accurate, complete, and consistent, and that it has not been modified or corrupted by unauthorized parties.

Confidentiality means that the data is protected from unauthorized access or disclosure, and that it respects the privacy and security of the data owners or subjects. A data retention policy can help an organization to comply with the legal or regulatory requirements, to support the business or operational needs, and to reduce the storage or management costs of the data. Ensuring that data is destroyed properly, ensuring that data recovery can be done on the data, and ensuring the availability of data for a predetermined amount of time are not the main goals of a data retention policy, as they are related to the disposal, restoration, or accessibility of the data, not the integrity or confidentiality of the data. NEW QUESTION # 1153

A cloud service provider requires its customer organizations to enable maximum audit logging for its data storage service and to retain the logs for the period of three months. The audit logging generates extremely high amount of logs. What is the MOST appropriate strategy for the log retention?

- A. Keep last week's logs in an online storage and the rest in an offline storage.
- B. Keep all logs in an offline storage.
- C. Keep all logs in an online storage.
- D. Keep last week's logs in an online storage and the rest in a near-line storage.

Answer: A

NEW QUESTION # 1154

Which of the following is a secure design principle for a new product?

- A. Build in appropriate levels of fault tolerance.
- B. Do not rely on previously used code.
- C. Restrict the use of modularization.
- D. Utilize obfuscation whenever possible.

Answer: A

Explanation:

Building in appropriate levels of fault tolerance is a secure design principle for a new product. Fault tolerance is the ability of a system or a component to continue functioning correctly and reliably in the event of a failure, error, or disruption, such as a hardware malfunction, a power outage, or a network attack. Building in appropriate levels of fault tolerance can enhance the security, availability, and resilience of a system or a product, by providing mechanisms such as redundancy, backup, recovery, failover, or self-healing. Building in appropriate levels of fault tolerance can also prevent or mitigate the impact of potential threats or vulnerabilities, and ensure the continuity of the business operations and services. The other options are not secure design principles for a new product, as they either do not enhance the security, availability, or resilience of the system or the product, or do not follow the best practices or standards for software development.

NEW QUESTION # 1155

Which of the following is the PRIMARY mechanism used to limit the range of objects available to a given subject within different execution domains?

- A. Process isolation
- B. Use of discrete layering and Application Programming Interfaces (API)
- C. Virtual Private Network (VPN)
- D. Data hiding and abstraction

Answer: A

Explanation:

Process isolation is one of the fundamental requirements in a multilevel security mode system.
