---

1/7

Our company has always been following the trend of the 3V0-21.25 Certification. The content of our 3V0-21.25 practice materials is chosen so carefully that all the questions for the exam are contained. And our 3V0-21.25 study materials have three formats which help you to read, test and study anytime, anywhere. This means with our products you can prepare for exams efficiently. If you desire a VMware certification, our products are your best choice.

Maybe you severely need a proper guide for your 3V0-21.25 exam test. Do not seek with aimless any more. Our VMware 3V0-21.25 exam guide will clear your confusion and help you out the difficulties. We offer the 3V0-21.25 original questions with verified answers. Our 3V0-21.25 PC test engine benefits you in your actual test. It has been tested and verified malware-free software, which ensure the safety installation. Besides, 3V0-21.25 PC test engine possess the characteristic of score comparison and improvement check. The customizable and intelligent 3V0-21.25 study material can help you pass your exam at your first attempt.

## VMware 3V0-21.25 Valid Exam Braindumps | New 3V0-21.25 Test Sims

You may know that we are so popular for the passing rate of our 3V0-21.25 guide quiz is very high. Generally speaking, 98% - 99% of the users can successfully pass the 3V0-21.25 exam, obtaining the corresponding certificate. In addition, the content of our 3V0-21.25 Exam Materials is easy to learn and suitable for the public. No matter what your previous learning level is, there will be no problem of understanding.

## VMware Advanced VMware Cloud Foundation 9.0 Automation Sample Questions (Q53-Q58):

### NEW QUESTION # 53

An administrator has been tasked with creating a region to provide resources to an Organization in VMware Cloud Foundation (VCF) Automation.

The following information has been provided to the administrator for this task:

- \* Two workload domains are configured and will integrate with the region.
- \* All workload domains are configured to share a VMware NSX Manager.
- \* All workload domains are configured with VMware vSAN storage.
- \* All workload domain VMware vCenter instances have a Supervisor enabled.

Before creating the region, what two additional configurations should the administrator validate? (Choose two.)

- A. All required storage classes are present and have the same names across all vCenter instances.
- B. A Region Quota has been created and associated with the Organization.
- C. All required virtual machine (VM) classes are present and have the same names across all vCenter instances.
- D. All Supervisors are configured with the same services across all vCenter instances.
- E. An AllApps Organization has been created.

**Answer: A,C**

Explanation:

In VCF 9.0, a Region is a logical grouping of resources (typically spanning multiple vCenter/Supervisor instances) that is presented to an Organization for consumption. For the automation engine to treat multiple clusters or vCenter instances as a single, unified pool of capacity, there must be absolute naming parity for resource types. If a blueprint requests a "Large-Memory" VM Class or a "Gold-Storage" Storage Class, that specific name must exist and be configured identically on every Supervisor instance within the region. If naming differs—for example, "Gold-Tier" on one and "Gold-Storage" on another—the provisioning engine will fail to find a consistent placement target, leading to deployment errors. Validating that VM Classes and Storage Classes are synchronized in name and availability across all participating workload domains is a mandatory "Day 0" task before the logical Region construct can be finalized in the Provider Management Portal.

### NEW QUESTION # 54

An organization is experiencing rapid growth, and the VMware Cloud Foundation (VCF) administrator needs to ensure that the "Development" organization does not consume all available physical resources in the "West" region, which is shared with the "Production" organization.

What should the administrator configure to limit the total CPU and Memory consumption for the Development organization?

- A. Apply a vSphere Limit on the Supervisor clusters.
- B. Create a Resource Pool in vCenter and move all Development VMs into it.
- C. Modify the Project constraints within the Development organization to include hard limits.
- D. Configure a Region Quota for the Development organization within the Provider Management Portal.

**Answer: D**

Explanation:

In the multi-tenant architecture of VCF 9.0, Region Quotas are the primary administrative tool used by the provider to enforce resource governance. While vCenter resource pools (Option A) or vSphere limits (Option C) operate at a lower infrastructure layer, they do not integrate natively with the VCF Automation consumption model and can lead to unpredictable scheduling issues. By configuring a Region Quota within the Provider Management Portal, the administrator sets an upper bound on the total CPU, Memory, and Storage that a specific organization can request from the "West" region. When users in the Development organization attempt to deploy a new blueprint or scale an existing service, the automation engine checks the current consumption against this quota. If the request exceeds the limit, the deployment is blocked before it ever reaches the vCenter layer. This ensures that "noisy neighbors" cannot starve other mission-critical organizations—like Production—of essential capacity, allowing for fair and predictable resource sharing across the unified VCF 9.0 fleet.

### NEW QUESTION # 55

An administrator is deploying a Supervisor cluster in VMware Cloud Foundation (VCF) Automation and notices that only one vSphere zone is configured in the deployment workflow.

Which statement best describes the capabilities of the Supervisor cluster being deployed?

- A. The cluster enables the use of a single control plane across multiple vCenter instances.
- B. The cluster will span multiple vSphere clusters for high availability.
- C. The cluster will automatically upgrade to multi-zone when additional zones are provided.
- **D. The cluster will not have zone-level fault isolation.**

**Answer: D**

Explanation:

VCF 9.0 supports both Single-Zone and Multi-Zone Supervisor cluster deployments. In a single-zone deployment, all Supervisor control plane VMs and worker nodes reside within a single logical and physical fault domain (a single vSphere cluster). Consequently, the cluster will not have zone-level fault isolation. If the underlying hardware, power, or top-of-rack switch for that specific zone fails, the entire Supervisor instance and all hosted workloads (VMs and Pods) will go offline. Multi-zone clusters, by contrast, distribute nodes across three distinct zones to ensure that the control plane and workloads can survive the complete loss of one zone. While a single-zone cluster is suitable for non-critical development or testing, it represents a significant risk for production environments that require the high-availability and fault-tolerance features inherent to the VCF 9.0 multi-zone architecture.

### NEW QUESTION # 56

A VMware Cloud Foundation (VCF) Automation administrator is creating a new organization for the Product Development team. The developers require self-service networking that allows them to:

- \* Provision workloads with virtual machines (VMs) and Kubernetes services.
- \* Attach these workloads to VPCs.
- \* Customize how ingress and egress traffic is handled.

Which configuration meets the requirement?

- **A. Create an AllApps Organization and use the default VPC with VPC connectivity profiles.**
- B. Create a VMApps Organization and assign multiple vSphere-backed networks for consumers to select as needed.
- C. Create an AllApps Organization and assign multiple vSphere-backed networks for consumers to select as needed.
- D. Create a VMApps Organization and use the default VPC with VPC connectivity profiles.

**Answer: A**

Explanation:

To meet the requirement for self-service networking that supports both VMs and Kubernetes (K8s) within a VPC framework, the administrator must deploy an AllApps Organization. In VCF 9.0, the VMApps model is restricted to traditional vSphere-backed networking and does not support the native VPC construct required by the team. By choosing AllApps, the administrator can utilize the Default VPC provided during the Region- to-Organization mapping. This VPC is governed by VPC Connectivity Profiles, which allow the administrator to define how the organization handles traffic—for instance, allowing the development team to manage their own SNAT/DNAT rules and load balancers for ingress control while maintaining the security guardrails set by the provider. This specific combination of the AllApps Organization type and VPC-centric networking is the only way to provide the requested level of flexibility for "modern" developers who need to manage their own application networking stack alongside their containerized and virtualized services.

### NEW QUESTION # 57

A Provider administrator received a technical requirement mandating the use of Identity Providers (IdP) in place of local accounts. The following requirements were defined:

- \* The source directory service must be different between the Provider Management Portal and Organizations.
- \* The Organization administrators cannot modify the identity provider configuration.

What two requirements should the administrator configure? (Choose two.)

- A. Setup custom LDAP service configuration per organization.
- **B. Ensure that "Do not use LDAP" is configured for each organization's SSO.**
- C. Configure and publish a custom organization role for all organizations.
- **D. Deploy an Identity Broker cluster per organization.**
- E. Push the VCF Automation system LDAP service to all organizations.

**Answer: B,D**

Explanation:

VCF 9.0 Automation uses a decentralized identity architecture to support complex multi-tenant requirements.

To ensure that the Provider Management Portal and Organizations use different source directories (e.g., the provider uses a management AD while tenants use their own OIDC/SAML IdPs), the administrator must Deploy an Identity Broker cluster per organization. The Identity Broker acts as the localized gateway for authentication for that specific tenant. To prevent Organization administrators from modifying these settings- satisfying the second requirement-the provider must Ensure that "Do not use LDAP" is configured for the organization's standard SSO settings. This configuration forces the organization to rely exclusively on the broker-mediated IdP managed at the provider level, effectively "locking" the identity configuration and preventing local tenant admins from reverting to a manual LDAP setup that might bypass corporate security policies or the centralized identity strategy.

## NEW QUESTION # 58

.....

As the old saying goes people change with the times. People must constantly update their stocks of knowledge and improve their practical ability. Passing the test 3V0-21.25 certification can help you achieve that and buying our 3V0-21.25 test practice dump can help you pass the test smoothly. Our 3V0-21.25 study question is superior to other same kinds of study materials in many aspects. Our products' test bank covers the entire syllabus of the test and all the possible questions which may appear in the test. Each question and answer has been verified by the industry experts. The research and production of our 3V0-21.25 Exam Questions are undertaken by our first-tier expert team.
