

CCRN-Pediatric Practice Exams, CCRN-Pediatric Best Preparation Materials

CCRN Pediatric Practice Exam Questions from AACN with Answers 2024

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
 - B) Encourage the parents to minimize their expression of grief with the sibling
 - C) Explain to the sibling that the infant went to heaven
 - D) Explain to the sibling that thoughts and wishes did not cause the infant's death
- ✓ Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.

A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.

B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes

C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
- B) the patient having a CT scan followed by possible shunt revision
- C) Administering mannitol or hypertonic saline
- D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx)

✓ Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.

A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP shunt malfunction. Additionally, lumbar puncture is contraindicated in the presence of increased intracranial pressure, because downward herniation of the brainstem can occur.

The Exam4Free wants to win the trust of Critical Care Nursing Exam (CCRN-Pediatric) certification exam candidates. To achieve this objective Exam4Free is presenting Valid, Real, and Updated Critical Care Nursing Exam (CCRN-Pediatric) exam questions in three different formats. These formats have high demand in the market and offer the easiest and quick way for Critical Care Nursing Exam (CCRN-Pediatric) exam preparation.

AACN Critical Care Nursing Exam Sample Questions (Q95-Q100):

NEW QUESTION # 95

How would a nurse interpret the behavior of a group of 3-year-old girls playing with their dolls?

- A. misuse of magical thinking
- B. result of abstract thinking
- C. appropriate make-believe play
- D. inappropriate exclusion of boys

Answer: C

Explanation:

Explanation: Preschool children use imitation of adult situations to help learn social skills, they enjoy make-believe play.

NEW QUESTION # 96

Why are unit admission and discharge criteria developed?

- A. Address triage decisions
- B. Identify criteria for withholding treatment
- C. Provide ethical decision-making guidelines
- D. Secure managed care contracts

Answer: C

Explanation:

Establishing admission and discharge criteria ensures that care decisions are consistent, justifiable, and ethically grounded. These criteria guide clinicians in resource allocation, promoting fair access and minimizing bias in treatment decisions.

"Admission/discharge policies support ethical care delivery by ensuring objective, equitable decision-making, especially in high-acuity environments like ICUs." (Referenced from CCRN Pediatric - Professional Caring and Ethical Practice: Ethical Resource Management and Clinical Guidelines)

NEW QUESTION # 97

A child was scheduled for a palliative surgery, which creates anastomosis of the subclavian artery to the pulmonary artery. This procedure is called:

- A. Coronary artery bypass
- B. Waterston-Cooley
- C. Blalock-Tausig
- D. Raskkind Procedure

Answer: C

Explanation:

Explanation: Blalock-Tausig procedure is just a temporary or palliative surgery which creates a shunt between the aorta and pulmonary artery so that the blood can leave the aorta and enter the pulmonary artery and thus oxygenating the lungs and return to the left side of the heart, then to the aorta then to the body. This procedure also makes use of the subclavian vein so pulse is not palpable at the right arm.

NEW QUESTION # 98

A pre-schooler is being prepared for an ear surgery in an ambulatory care facility. When the child is called to go to the operating room, the nurse should:

- A. Remove the child's toy.
- **B. Allow the parents to accompany the child until he is sedated.**
- C. Allow the child to walk from the unit.
- D. Ask the parents to leave the room and wait outside.

Answer: B

Explanation:

Explanation: Most health institutions allow the parents accompany the child until he is sedated and to stay with the child as long as possible. This minimizes the stress related to fearful events. Also, current theory is consistent that parents should remain during the induction of anesthesia due to parent's positive feedback.

NEW QUESTION # 99

In an infant with bronchopulmonary dysplasia (BPD), pathophysiologic consequences of chronic hypoxia include:

- A. Anemia
- **B. Cor pulmonale**
- C. Decreased pulmonary vascular resistance
- D. Increased systemic vascular resistance

Answer: B

Explanation:

Cor pulmonale refers to right ventricular hypertrophy and failure due to chronic pulmonary hypertension, a known complication of long-standing bronchopulmonary dysplasia (BPD) and chronic hypoxia in infants.

"Chronic hypoxia and pulmonary inflammation in BPD lead to vascular remodeling and increased pulmonary vascular resistance, resulting in right heart strain and cor pulmonale." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Chronic Lung Disease and Cardiac Effects)

NEW QUESTION # 100

.....

The web-based CCRN-Pediatric practice test frees you from the need for software installation. It is compatible with all operating systems. The web-based Critical Care Nursing Exam (CCRN-Pediatric) practice test of requires no special plugins to function properly.
