In this hustling society, our CCRN-Pediatric practice materials are highly beneficial existence which can not only help you master effective knowledge but pass the exam effectively. They have a prominent role to improve your soft-power of personal capacity and boost your confidence of conquering the exam with efficiency. You will be cast in light of career acceptance and put individual ability to display. When you apply for a job you could have more opportunities than others. What is more, there is no interminable cover charge for our CCRN-Pediatric practice materials priced with reasonable prices for your information. Considering about all benefits mentioned above, you must have huge interest to them.

### AACN Critical Care Nursing Exam Sample Questions (Q10-Q15):

#### NEW QUESTION # 10

On assessment, the nurse notes that a 10-month-old child searches for and retrieves toys that disappear from view. Based on Piaget's stages of cognitive development, the nurse would recommend which of the following toys or games?

- A. Rattle
- B. Nesting toys
- C. Peek-a-boo
- D. Throw and retrieve

**Answer: B**

Explanation:

Explanation: A nesting toy makes a good toy for a 10-month-old infant. At 8 to 12 months, or during the coordination of secondary reactions, the child begins to learn that objects in the environment are permanent. That is why the child searches for and retrieves toys that disappear from view. It is also during this time that infants experience separation anxiety.

#### NEW QUESTION # 11

What type of play is most appropriate for a 6 year old child:

- A. make believe
- B. hide and seek
- C. peek-a-boo
- D. building blocks

**Answer: A**

Explanation:

Explanation: Make believe is most appropriate because it enhances the imitative play and imagination of the preschooler. Peek-a-boo and building blocks are appropriate for infants, while hide and seek is applicable to school age children.

#### NEW QUESTION # 12

A nursing practice council is reviewing a protocol for flushing unused IV lines. A team member questions the use of saline vs. dextrose. What should the council do first?

- A. Develop research methods
- B. Identify the outcomes
- C. Determine the problem
- D. Plan interventions

**Answer: C**

Explanation:

The first step in any evidence-based practice (EBP) or quality improvement (QI) process is to clearly define the clinical problem or question. Before outcomes or interventions are addressed, the council must determine the exact issue to be studied.

"In quality improvement and evidence-based practice, step one is always problem identification. A well-defined problem leads to targeted and effective research." (Referenced from CCRN Pediatric - Professional Caring and Ethical Practice: Evidence-Based Practice and QI Models)

### NEW QUESTION # 13

A pediatric client is evaluated for a surgery in order to correct Strabismus. During history taking, the nurse learns that the parents had their child examined when they first noticed:

- A. unusual blinking
- B. bloodshot eyes
- **C. frequent squinting**
- D. excessive tears

#### Answer: C

Explanation:

Explanation: The classic sign of Strabismus is squinting. It occurs because of the misalignment of the eyes.

### NEW QUESTION # 14

A 9-year-old patient with a history of tachycardia and syncope is connected to a monitor that shows a HR of 190, with regular P-P and R-R intervals. The patient is awake, crying, anxious, and has a BP of 94/60. Which of the following is the initial nursing intervention?

- A. Instruct the parent to "put this ice bag on the child's head."
- B. Have the parent hold the child while securing IV access
- C. Prepare for sedation and cardioversion
- **D. Have the child pretend to play a horn while blowing through a straw**

#### Answer: D

Explanation:

The patient is stable with supraventricular tachycardia (SVT). Initial treatment in stable pediatric SVT involves vagal maneuvers to increase vagal tone and potentially terminate the arrhythmia. Having the child blow through a straw or simulate blowing a horn is a safe and effective method in a cooperative child.

"In stable pediatric patients with SVT, vagal maneuvers are the first-line intervention. Activities such as forced exhalation (blowing through a straw) may revert the rhythm." (Referenced from CCRN Pediatric - Direct Care: Cardiovascular, Pediatric Tachyarrhythmias Management)

### NEW QUESTION # 15

.....

We provide top quality verified AACN certifications preparation material for all the CCRN-Pediatric exams. Our CCRN-Pediatric certified experts have curated questions and answers that will be asked in the real exam, and we provide money back guarantee on Braindumpst AACN preparation material.
