CCRN Pediatric Practice Exam Questions and Answers 2024 from AACN

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
 - B) Encourage the parents to minimize their expression of grief with the sibling
 - C) Explain to the sibling that the infant went to heaven
 - D) Explain to the sibling that thoughts and wishes did not cause the infant's death - Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
 - B) the patient having a CT scan followed by possible shunt revision
 - C) Administering mannitol or hypertonic saline
 - D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx) - Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.
- A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP shunt malfunction. Additionally, lumbar puncture is contraindicated in the presence of increased intracranial pressure, because downward herniation of the brainstem can occur.
- C) Administering mannitol or hypertonic saline: These medication are indicated for the medical management of increased intracranial pressure, of which this patient has

Our website offer considerate 24/7 services with non-stopping care for you. Although we cannot contact with each other face to face, but there are no disparate treatments and we treat every customer with consideration like we are around you at every stage during your review process. We will offer help insofar as I can. Some company refused to rescind customers' money when they fail unfortunately at the end of the day. While our CCRN-Pediatric practice materials are beneficiary even you lose your chance of winning this time. Full refund or other version switch is accessible.

The CCRN-Pediatric Exam is a computer-based test that assesses a nurse's knowledge and skills in the care of critically ill children, including infants, toddlers, and adolescents. CCRN-Pediatric exam consists of 150 multiple-choice questions and covers a range of topics related to pediatric critical care, such as cardiovascular, respiratory, neurological, and gastrointestinal systems, as well as trauma, pharmacology, and ethical considerations. Nurses who pass the exam earn the CCRN-Pediatric certification, which is valid for three years and can be renewed through continued education and professional development.

Topics of AACN CCRN-Pediatric: Critical Care Nursing Exam

AACN CCRN exam dumps include the following topics:

Free CCRN-Pediatric Practice Exams & Valid CCRN-Pediatric Test Practice

cracking the AACN CCRN-Pediatric examination needs preparation from an updated AACN CCRN-Pediatric exam questions. To pave your way towards exam success, ITExamDownload has hired a team of professionals. They have compiled real CCRN-Pediatric Exam Dumps after thorough analysis of past exams and examination content. These CCRN-Pediatric Exam Dumps are actual, authentic, realistic, and will eliminate your chance of failure in the Critical Care Nursing Exam CCRN-Pediatric examination.

To be eligible to take the AACN CCRN-Pediatric Certification Exam, nurses must have a current, unrestricted RN license in the United States or its territories. They must also have at least 1,750 hours of direct bedside care in a pediatric critical care setting within the previous two years, or at least 2,000 hours of direct bedside care in a pediatric critical care setting within the previous five years. Nurses who meet these eligibility requirements can apply to take the exam online.

AACN Critical Care Nursing Exam Sample Questions (Q89-Q94):

NEW QUESTION # 89

When is the best time to do a corrective surgery for an infant with hypospadias:

- A. Anytime during pre school age
- B. 72 hours after birth
- C. Within few months after birth
- D. 6-18 months of age.

Answer: D

Explanation:

Explanation: 6-18 months is the preferred age to do a corrective surgery for an infant with hypospadias because fear of castration and body image is not yet developed. It can't be performed shortly after birth because the phallus is not developed enough. Fear of bodily mutilation is present during pre school age.

NEW QUESTION # 90

A 3-year-old near-drowning child who is intubated and mechanically ventilated exhibits increased peak inspiratory pressures and decreased O₂ saturation. Stat chest x-ray reveals diffuse pulmonary infiltrates. No improvement is exhibited after an increase in FiO₂. The nurse should suspect:

- A. ET tube displacement
- B. Respiratory distress syndrome (RDS)
- C. Aspiration pneumonitis
- D. Pneumothorax

Answer: B

Explanation:

Following near-drowning, the child may develop pediatric acute respiratory distress syndrome (PARDS).

This manifests as non-cardiogenic pulmonary edema with diffuse alveolar damage, resulting in poor oxygenation and elevated airway pressures.

"In cases of near-drowning, the patient may progress to ARDS with bilateral pulmonary infiltrates and refractory hypoxemia despite increasing FiO₂. Mechanical ventilation strategies should be adjusted accordingly." (Referenced from CCRN Pediatric - Direct Care: Pulmonary Dysfunction and Ventilator Management)

NEW QUESTION # 91

A student nurse is caring for a 4-year old child diagnosed with croup and the clinical instructor asks the student about the clinical manifestations associated with the illness. Which statement by the student indicates a need for further research:

- A. inspiratory stridor and a low-grade fever may be present
- B. symptoms usually worsen at night and are better during the day
- C. symptoms usually worsen during the day and are relieved during sleep
- D. cough is harsh and brassy

Answer: C

Explanation:

Explanation: Croup often begins at night and may be preceded by several days of upper respiratory infection symptoms. Croup is characterized by a sudden onset of a harsh, brassy cough, sore throat, and inspiratory stridor. Symptoms usually worsen at night and are better in the day. Croup usually is accompanied by a low-grade fever.

NEW QUESTION # 92

A toddler admitted to the hospital has malabsorption syndrome and later develops signs and symptoms of tetany. The nurse is aware that this is due to insufficient absorption of:

- A. Calcium
- B. Sodium
- C. Potassium
- D. Zinc

Answer: A

Explanation:

Explanation: Muscle contraction and relaxation cycle needs normal serum calcium:phosphorous ratio.

The reduction of the ionized serum calcium level associated with malabsorption syndrome causes spastic muscle spasms.

NEW QUESTION # 93

When determining the effectiveness of teaching a child's mother about sickle cell disease, which of the following statements by the mother indicates the need for additional teaching:

- A. "I've started to give him some extra fluids with and between meals."
- B. "I've told the child's father that both he and I are carriers of the disease."
- C. "He's going to be playing on a soccer team when he's feeling better."
- D. "I'm concerned about how the hospital staff will manage his pain."

Answer: C

Explanation:

Explanation: "He's going to be playing on a soccer team when he's feeling better" definitely indicated the need of additional teaching. Physical and emotional stress can precipitate a sickle cell crisis. Physical exercise such as running involved in soccer would increase the child's risk for a crisis. Thus, the mother needs additional instructions about this area.
